Notes of Candidates

Arnold —inglés: estoy buscando algo en los que primero pueda probar estando en mi empleo, probemos 3 meses y miremos como nos va. Tengo mas de 7 anos de experiencia en scrapping, todas las paginas del gobierno colombiano las he scrapeado.
Tangelo — 5 years of experience, squad lead in the last 3 years. I manage a team of 10 developers, work on squad lead, execution. Architecture. Scraping. Police department squad, Contraloria. Now I am doing payments and integrations with payments providers. All websites have a token, json.
Mexfix — i did crapping for sending money to investors. Mexfix is an invoice financing company. PayU, didnt have an api for us to send the money, so all of these we did it through scraping. I built with Selenium and beautiful soup. I also bypass captcha from the police department and more complex by google.
Tangelo 20-25 horas — I am squad lead, I have management work and development work.
Bold — I was iterating a project on payments in architecture.

$3k-$4k — hoy gana $4k
Cesar Pimiento

……..
Jose Miguel - Examedi
TechStack: Python con Django (60%) / React (40%)
Webscraping: resultados de los laboratorios, boletas de laboratorios, no tienen ningún tipo de interfaz por api para conectarnos entonces tenemos que hacer webscraper para leer los datos y descargarlos. He hecho varios web scrapers, beautfulsoup.
$5500 usd

_____
Great Brazil dev https://oarremate.com.br website entrepre

_____
Misael Torres - web scraping engineer
BBVA — position of security engineer - devops, not web scraping. Optimization.
Shelf-e — web scrapping for amazon and mercado libre, we worked for Walmart Mexico, Soriano. Our final client were the providers which sell the products in these eccomerces. What info - data of prices, stock, visibility of the products, we had to obtain that data. Get the product description. We built some dashboards, and reports.I worked organizing the data that we scanned and Jason file to be consumed by other teams.
30 scrapers — Mexico and latam —

I had to manage all the third party proxies.
Selenium, java, htmlUnit, Jsoup, beautiful soup, request, pandas
Java - 5
Python - 1
Teamcore — mainly I had to maintain all the scrapers, 10 scrapers for e-commerce. Not just commercial info but also from providers websites that are specifically for providers. Create the scrapers to enter that providers websites. We had the opportunity to collaborate with different teams so I learned selenium and python. Selenium is a framework that consumes more CPU resources. Beautiful soup is better, with selenium you work with your UI in your computer, it emulates a human. But others like Beautiful Soup do it on the background. My understanding is that scrapy is more complex as it combines different lilbraries.
I like webscrping —
$2.6k

_____

Salomon Novoa —
Seguros Bolivar — analyst, calculated the prices of the insurance products. Power Bi, creating the pricing calculator, different components of sinestralities.
Cable and Wireless — Tableau sql
Shopee — people were so smart. I was in charge of creating BI projects in 5 departments. Tax, product, customer experience, listings and payments. First scraper — conciliation with international sellers. Get info of Mercado Libre. What products they were sellers. Scraper to get info from google maps and intagram. I have to do a lot of proxies usage.
Iceberg data — his boss from Shopee recruited him — built infrastructure for the company in GCP. Different kind of websites.
For e-commerce— Mercado libre, homecenter and fallabella, temu.
Lawyer — sell for different cases that they don't have a defendant.
Scrapped finca raíz, idealista, bayut (uae), seloger (Canada),
Security company — all the panos from a city. If somebody stole something and you have the video, give exact location of that video. Difficult to get the panels, get the panels of that city.
PH DATA — Chick Fill A — USA — identify the sentiment of different reviews. Scraping google maps and google reviews. Build a sentiment engine. Top 3 strengths, weaknesses.
USDA — website of crops production per county of each month of each year. CHS inc — agribusiness corporation — for them I built two websites. All info was in two websites. I go above and beyond. Ive been
Web scrapers — I haven't found —
techdstack: request, beatifulsoup, selenium, playwright. Python and JavaScript. Playwright is very difficult to detect.
Career: Usa company, Latam team, I work with usa. Work environment, flexibility, more challenging topics, web scraping.
Salary: $6.5k — $8k
Part time — 8 hours per day — they pay us for these certification —

_____

Fabio Melo —
RedRex — data projects. 4 projects, data warehouses. Insurance health insurance. Pay for insurance. How much is the price for a meeting with doctors and appointments. Parttime job
Justbrasil — collecting law suit process, crawlers to get access to the courts, and the cases. I put the number in one software. Need to build the right kind of crawler.
Ascential — Intelllifood — from DoorDash, Ubers eats, food, grubhub. USa Canada, mexico, latam, South Korea, India, dubai,
Intellibrand — collect data from 600 e-commerce websites from latam and Brazil, pharmacy, amazon, mercado libre, and small e-commerce websites, we built an entire system to collect this data.A lot of sites, 2 million restaurants daily, 1 petabyte of data monthly. Crawlers using typescript.

We write from scratch.
100 + scrapped websites. Understand how the apis were working.
Now is a part time job
Tech stack: Javascript In Javascript Axios, Puppeteer in Python Selenium httpx, Beautiful soup,
I don't like to use scrapy, limitation.
Salary: $22k reais — 4k dollars — looking projects.
ALEJO LOPEZ
TypeScript, NodeJS
Scraping
Selenium Scrapy Beautifulsoup
Playwright

_____
Sergio — Proyecto — Scrapy
Problemas si no se hace
Full-time con Diplo — se mane jar mi tiempo —
Compensation —
Notice time — 15 dias — 10 Dias — 29-5 PTO vacaciones: Aruba
Link booster — trabajo por ticket — spiders, cosas simples, solo trabajar con bitmaker que es mas simple. Mantenimiento de spiders.
Spiders, modular, tiene muchas cosas hechas para middleware, ellos usan AWS, pero el deployment es diferente.

_____
DELFINA — lazo
Acompanamiento en ronda
Documentos que acostumbramos tener.
Founder vesting agreement — Como the vas a ir, con cuantas acciones,
Equity incentive plan — mecanismos.
cofounder: Si otra persona entra: ceder parte de las acciones o emitir nuevas. El estándar es dar de las que tengo.
Empleado y advisor: solo se saca a partir de ahi si le queremos dar esto a un empleado o a un advisor. 0,2 al 2%.
Inversor: se firma un SAFE donde se prometen diferentes acciones dependiendo de los escenarios. Eventos de conversion. Acciones preferidas. Preferencia en el cobro.

_____
MATIAS MARTINI — FINTUAL
Full stack — in the beggining I was in fintual Mexico. I was largening my scope in the company. Best practices. I like to validate my criteria. I started working on front and web and product.
Head of Tech in Mexico — take decisions on infrastructure. Taking decisions when it comes to which services we have to deploy and develop. If we need to deploy something. Make the call on how to use each technologies, which data base to use, technical documents.
The initial step is almost always, me doing documentation, understanding what they need. Then for the product side, we have a head of product and head of operations.
When we have big projects I am involved on the design step. Whiteboarding sessions, to have a technology plan and technical documentation. Some people from the operation team come with these solution, describe a problem and how we solve it. Come with a diagram. The process. Discuss every detail.

Event storming session — we try to follow, as it is event driven architecture, a lot of distributed transactions, in this particular way it makes sense to make an event architecture, as every event has an output. Async communication. We receive a message, if you don't have an event driven architecture, you will be less efficient.
Domain driven design vs domain oriented arquitecture — separate your business logic in domains and make the implementation of that model. A way in which you model your business through the code.
Event driven is when the business is async — because the nature of our business is async as we have a lot of processing time. You may want to have asynchronous communication. We are doing that task and we will let you know when the task is finished. A solution for a real problem, your domain, is compatible with this strategy.
When the user wants to generate a stage of an account or a report, I don't want the user to keep working when the process is finished, I will say that I will let you know when the process is done. If it is something that is back office.
When I have to request transactions to the bank API, in that moment the transactions can take up to 15 minutes, if the user wants to move money we will need a confirmation that the money is moved, in that case we will process the order, and we will let the user through an email or notification. When something takes time and you don't want the user to wait or experience delay we use event driven.
Delivery use case — for example in Rappi, I want to have an order, we are processing your order and we will let you know when is ready. I have the delivery in my power, there is a service that takes the order and update it and let the user know.
Payments and rewards case — I would use an asynchronous approach, if they recycle, if the service sends a message to the distributor, wait for the answer to the message and update the database. Send a push notification to the user. It depends on the scale of the application.
Being a Bridge Between Product Ops and Tech
First I like to understand how things are done, or what is the thing they want to improve and why. We have many meetings and product reviews, on things they want to improve.
Sometimes they want something right now, I am more of the idea that we need to have a good foundation, I understand the North Star of the company. Sometimes we need to do stuff, even if in tech doesn't make sense. 60% of the request, we don't want to do, to changing the backend, the foundation and models needs to be right, it should always should make sense, if a model is complicated to understand.
For example, I want to model an asset, part of your portfolio, if you have an idea of how to model this, data base, put a column for the name for an etf, show on the other column what is it, at first glance having empty cells will be confusing, what happen when we have to process this data. If is a mutual fund we do this, but if you are stressing a lot the data base, it would be easier if you have a separate table for each. That kind if stuff allows you to scale faster if you don't do it. It takes a lot of experience, to see that. Why product wanted everything together, it is bacause sometimes is faster to ship something that is not well done. But sometimes we need to think what is gonna happen next.
Day to Day / week to week
Monday — meetings to have the rest of the week to have as clean as possible — product review: here all the product managers and owners present the features and problems, why they want to do something, how, after they talked with users. We discuss some thoughts that we can have and I ask for details. Ex. We want to use AI to understand why the portfolio went down, we do a Figma to show how it would look like, if it is approved by the head of product. Here we focus more on bigger features. Then I have meetings with the CTO.
Monday Strategy meetings, we discuss some projects that are way bigger and more strategical. Like being a bank, or opening a new feature. I talk with the CEO. Understand what are the plans for Mexico.
Tech Team Meeting — for my, I need a designer, product owner and developer. Discovery phase — Then Prepare the Teams. We have the onboarding, advisory and distribution teams, a new feature needs to be taken by one of these teams, who will take one of these features.

Doing a technical document and a product document. They have to do it.
My job is helping the dev who is working on it to create that document, check the data model, new processes, I need to understand how the feature is gonna be done.
I also help them when they need help. In Fintual everyone is very vulnerable. I am trying to help everyone. Also ask what we don't know. My devs come to me openly. I try to help the ones who need help.
I have projects for myself as well. I meet with the CTO and we work on new things related to architecture and tech planning, prepare repository for spinning up the entire stack locally, we want to create our dedicated service for dynamic links, I work in these kind of stuff. On Monday I have a meeting with the CTO and then on the C level council, decide who takes something and how we resolve it. Structural work and projects, as we don't have any platform team we do it ourselves. We have some backends that take care of the infrastructure and I work with them, I have to create new services, spin up on production, I do DevOps.
Most of our engineers are full stack, we split teams on domains. We have onboarding, compliance, advisory, investing. We have the distributing team, we deal with all the accountability and transactions. Then we have the stock team to let the users buy stocks and etls. Some devs are so good in backend and frontend, but most of them do everything.
AI Projects — we have a chatbot that is a copilot — Fintual CoPilot — that chat is link with the backend service, do performance analysis of your portfolio, and analysis of your stock. I am not actively developing it but I worked on some features.
Techstack: VueJS, React, React Native, Golang, Python, Ruby on Rails, async, GraphQL, Kubernetes, Lambda functions, SQS, Terraform, GitHub actions, AWS.
I am decent on React Native
Estudios Eléctricos — research and dev engineer, I worked on the engineering team to build some internal solution. C, C++, I built digital simulation engine. Web applications, simulate entire power system networks, I worked for Central American energy regulator, to check the limits of the power transfer between countries. Taking info from power stations, we work with physics and calculation to see if the level was over the limit or not.
We were two developers and the founder. The job was challenging, it was very hard, you have to understand a lot of things, read science papers, create something that nobody else had created.
I don't want something that takes me away from coding. I really wanted to code.

Salary: $120k
Travel ok
European passport

_____

Jose story. +584244053101
TechStack: Golang, Java, Python, Django, NodeJS, PHP, Scala, JavaScript, Typescript, SQL, Postgres, DimanoDB, Redix, Kaska, SNS, Kubernetes, Docker, Jenkins, AWS.
React Native — I am running a project parallel to story, we have a low-cost supermarket. They looked for me because they want to create an app for delivery, 15 stores. The invoices are around 12 million dollars every month, the monthly sales. I am building the app with a small team and it is in React Native, I am doing this on the weekends. The backend is in Django. They had some technical issues. I came to the project to accelerate it.
Stori — en Mexico tienen 4 millones de usuarios, un ano después de que yo entro se salen de colombia para darle foco a que Mexico sea rentable.
I worked with home and login. Now I am the loan management team, personal loans. My goal is scaling the product, have availability, having an architecture. Rebuilding the airplane during the flight.
Golang, on Lambdas,
Miniprogram — React Native, Flutter multiplatform.

WeChat mindset — it is based on web, html, javascript, do the call, the api call to the backend. Multiplatform. It can work on iOS and android, just like React Native or anything.
We are migrating to a new framework based on mini program.
I am using Windsurf and Cursor
Rappi —
Payments — I was in charge of building the payments system, even credit card, payments in general. PSE, Google Pay, Apple Pay. User Payments Platform. Boss was Pablo Abab.
Curries Payments, how Rappi paid Rappitenderos, how we disperse Rappitenderos, and also how Rappitenderos pay the cash. Though effecty. 26 for Chile. Mexico we have ultra mobile.
How we pay to the partners — restaurants, supermarkets. How we pay them. The conciliation, it was the hardest part.
Techstack: Golang, on Kotlin (Android) and Swift (iOS) to the customer. Having all
Architecture — what principles did I use? When I build software as an architect, one of my principles, one single point of responsibility. Separate responsibilities by domain. Domain can be a user, conciliation, something specific.it became a leverage of growth, if we wanted growth, we let the power user, a user that spend more than 2 million pesos lets say. We needed having over 2 million dollars in debt.
I had 26 microservices, one micro service that was in charge of the debt.
 If the user is a power user, if the card is rejected of a small order, just give him the order, and for the next order create the restrictions. In some moment, we did that.
SOLID architecture — it is easy to design and easy to maintain. We can combine with event driven architecture. A microservice has a single responsibility to manage debt, conciliation, connect to a payment provider. Once the user pays the debt to follow the example, I can create an event and I say the user just paid their debt, whatever or whoever is interested in that info will get it, for example the conciliation team. I produce the event or support team is interested in this kind of info because they manage the client.
Pablo — vision of payments, how the payment was created. The provider is compaining, let's create some layer, principles, communication between areas.
How to manage a crisis — how to manage a customer who is upset — in 2019 in the mother's day, Rappi crashed, we lost the day, if AWS crashes how we manage that.
At Rappi, we have a monolith, when we came, we said this is painful, it is not gonna work, so we started to migrate to a micro service architecture, so we created thousands and thousands of micro services which wasn't a good practice. If we develop as juniors we don't think on performance. With money we mitigate bad programming. Every time that we have many traffic, we create a lot of services and then spend more money. We didn't prepare for mother's day scaling the services.
Having a real understanding of architecture, we want to optimize for traffic?
Home has all the traffic of the app, how do we manage that, every single time that the users goes to home, how do we manage, free charge, I know that usually for your location, I can show you all the items, I do the request in the background to give you some pre selected prooducts based on preferences and location. A home cannot be slow. We need to preprare the home.
Management — Planning and execute — a document with the vision of the business and product and the vision of the technical side.
Now I think of initiatives that achieve an objective. There is owners of the area and we sit together and we go to the initial document, we estimate that in weeks. I usually divide the projects on business and product, business and technical debt. This is my year.
I do two different ceremonies, planning, retrospectives, demo to the stakeholder.
Then we have reviews.
1:1 with my direct reports that are technical leads
1:1 with boss.
BlancLabs — startup projects in Canada. — EQ Bank Canada — https://www.eqbank.ca — I built the proposal , I had PM skills, and then we executed, basically creating a web page where the users can manage their loans. Personal Mortgage Management Platform. See the statements, the interest, how

much to pay. I built a layer to interact with the legacy system and offer a great experience to the customer. Techstack: Golang for some of the micro services. Mulesoft.
Then started my own company — a software for a hospital — erp for hospital, from scratch. What happened to me in that moment is that the general manager of Indra called me again, the software is having crashing and we need you. He came with his team as a vendor. Indra was my only client. 18 developers that I managed from Indra. I was still the engineering manager. I transformed my self as a java developer. I put all my energy.
InfoSoft — Senior Java Developer — Indra and Movistar. I got a new job as a technical lead and project lead, very obsessed with the customer. I built the customer app. How to pay, how to receive payments, I really liked the transactional environment. In that way, Movistar Venezuela.

_____
Gustavo Bordin —
Belvo — I started started as a scraper. It was not scraping just websites, but apps and banks, in order to scrape a bank, you need to bypass all security Barries. Encryption. Bypass a lot of things. I am not longer doing scraping. I work with a team, open finance, all the banks in Brazil, and we use their apis, that are very complex.
Now I am just calling APIs, 80% of my job is to create tickets because the APIs are not working, it is more like a customer engineer job.
ClubNFT — scrapers, I was scraping the blockchain. Startup that was backing up nft wallets. Scraping all NFTs in the blockchain. Create the backup on it. I used Golang to create users on the wallets.
Neoway — they have more than 1000 crawlers. They scrape data from everyone. They know all info from your LinkedIn, all the info of what the government has about you, and they sell this info to companies. Risk and compliance stuff. https://www.neoway.com.br
The crawlers that I did was for LinkedIn, and gov websites. I had to bypass Captchas. Many approaches. We had to spend a lot of money with id changes and proxies.
I created like 15. The scrapers broke a lot. Scrapy. Data Pipeline with Golang and Microservices. Combining multiple documents from the same person. I used golang for micro services to receive the data that the scrapers in Python were bringing.
http://www.jurid.com.br
Scraping over 27 courts, a lot of crawlers. Create a data pipeline to enrich the data and send it to our customers. Basically one court could have docs from a company, and I tried to consolidate the information of one company. I sent all data to the content platform. All these things was done manually, so after the automation it just took minutes. Python, Scrapy, Selenium. React to build an internal service to edit the documents. NodeJs. AWS. ECS. Lambdas.
23000 Brazilian reais
$4.5k

_____
PEDRO BARRETO ——— TOP STARTUP GUY**********
QSraus — consultoria y desarrollo digital, para marketing. Desarrollo web. Ayudamos a las empresas a desarrollar sus estrategias de marketing y work management. Work management tiene un flujo de trabajo en donde hacen una solicitud. Paso a paso para ejecutar. Marketo / Mailchimp para .
WorkFront de Adobe, Monday CRM, Asana, Jira, Notion, centralizar la gestión de proyectos porque ayuda a automatizar, proceso de comunicación constante, dashbaords, uno trabaja ciertas horas. Automatización de los flujos del trabajo.
Encargado del area de marketing —hablar con las empresas, entender sus necesidades de marketing digital y planteamos estrategias. Por ejemplo una empresa va a lanzar una actualización de su software, tenemos que hacer webinars, push notification, SEO, posts, etc, gestión del marketing de esos leads, como podemos gestionar por marketing digital. Usamos Hubspot, Marketo, Pardot, Elocua.
Lead Scoring — Gracias a las variables, hay personas mas interesadas y puede ser leads cualificados. Uno puede configurar en Hubspot ese tipo de cosas. La persona dio 10 clicks en los

últimos 2 meses. La persona trabaja en tal cosa que se acerca al perfil del cliente ideal. Embudo de marketing, desde que es un lead, contacto
Example: one of our client in the IT industry, they have an app, SaaS, the idea was to improve the workflow between marketing and sales, and implement a lead scoring model, sales team saw that leads were not hot enough, we implemented behaviors in our models, I proposed to do more engagements such as doing more webinars, because they needed to show the updates and show that they are evolving as a software and as a service. Apart from that we implemented SEO. Improving the keywords, amount of phrases, improve the probability of the keywords to be shown, keywords such as saas, image generation, what we propose is to improve the way. Improve the print in search engines. Using Hubspot, the way we were communicating Hubspot with Salesforce, we were doing duplicate leads, and we fixed. Before we got our hands in the system there were some incorrect set ups.
Salary: Now 3.5….. $4k-$5k

GABRIEL VICINTIN BARBOSA — Truora
Head of Growth and Former Founder. Growth at Truora (YC W19 / Accel / $22M+). Founder at brazilian payments api startup VCMD ($1M raised)
Truora— que he hecho, Reptil, n8n, proyectos de automatización. Tener conecto de la empresa. Tener proyectos de GEnAI. Cuando yo estaba liderando el tema de Truora en Brasil, en marketing fue un desafío interesante. Necesitábamos posicionar a Truora.
Hubspot — yo he hecho varios workflows de hubspot, no solo de la ejecución de las automatizaciónnes, pensar que es lo que tenemos que integrar.

SEO — no lo soy, lo seria ese experto, no seria para trafico pago. Trabaje con analistas, entendiendo cuando los analistas. Hice varios experimentos y mejoras, para el growth loop. Firme en contrato y arranca, pero si necesitan algo super técnico, no tengo esa capacidad.
Webhooks — alguien en un flujo de whatapp, utilizamos llamados de webhooks, para automatización. He hecho bastantes cosas de llamados, API skill, end points, defendiendo los triggers.
Cuales son las pautas, conversion,
Kiara — Triara — head of marketing, head of marketing.
Firma: Clickysign
Posicionar empresas, go-to-market, head de operaciones en brasil. Mas a modo discovery.
Reposición de la compañía en brasil. Me invitaron a ser parte de WhatsApp Engagement, mini startup dentro de trucar. 2023, habíamos hecho $1M de dólares de ARR, $3m en 2024 de ARR. Unificamos los procesos de
Antes estaba dividido por unidades de negocio, ahora esta dividido por regiones.
MetaMap — competencia de Truora — no me alinee muy bien y ahi llegue a Truora.
Consultor de tecnología. Implementando procesos de tecnología
Fintech — $1M — payments api for restaurants — integrar a los CRMs y hacer el pago. Fee sobre el consumo del usuario. Cargo de CEO de la compañía. Hicimos un plan de contención. Algo un tanto duro.
Hay una agencia en brasil de influencers, gastamos mucha plata y los influencers, solo nos dieron alcance, pero no clientes. Invitamos todos los influencers a un sitio en brasil en el sur. Invitamos toda la gente, hicimos asado, el gran aprendizaje es que el gran influencer no logra conectar tan bien como el micro influenciado. Antes pensábamos que no podia comunicar mas, pero los que se conectaban con su publico.
Brand booster — agencia. —

_____
EMMANUEL RUIZ —
Head of Marketing/Growth at Latam Top Startups. Currently Kashin (YC S22. Frmr Vendoo (YC W22), Konta (YC S21), Cargamos ($11M raised).
Why Do I think is a great fit?
Kashin — 100% mobile, OneSIgnal, Brevo, They have the problem that they can’t grow more than 2000 users. Now we have over 10000 users. Having content fit and message fit. It is not the same talking to a specific person, you need to write the right message to convert people. FOMO, JOMO (Joy of Missing Out). We attack the de
KOnta — we attack the declaration in Mexico, they are putting their resposabilities to one expert. When I can meet in front of the user, some of the user give feedback because they give us the responsibility that they have with the government.
Konta — I was the third person to come to the team, I take the whole responsibility. I take the SEO and also the CRM, the development department to make the rigtht product to the team. They didn’t have a sell service. I grew the team to 6 members. The acquisition grows alone. From 50 to 400 active monthly users. Tax forms for citizens.
Webhooks — the other
Vendoo — marketing and growth. Our website was built on Webflow. I am the owner of the SEO. Crosslisting Platform for Resellers. Paid media. SEO. I did the experiments. How could we get more google search leads, bring down the CAC. I started testing different challenges. They had all the ideas on google ads, I also did TikTok ads, and meta ads. When I came to the company I reduced the plans. I see that the user has one problem. They don’t understand what plan they need. If you need listings. If you have one to ten items you need this one…

SEO -I used ahrefs, that is a software for checking how our keywords are working. Check our positions. The first system that I did for this company was to check how they keywords work. I put a lot of keywords on the number 3 positions of google. I put in an excel this is the things that we need to write for someone else to write it.
My legacy in Vendoo was their position and retention. They had $1m in revenue and when I left $3M
Cargamos — encargado de Hubspot, me hacia cargo de las automatizaciónnes, b2b, interna como externa, mails, notificaciones, mensajes.
Part of the growth and marketing team. Paid advertisement, meta ads and LinkedIn ads. SEO — I didn't touch the SEO in the company.
OKR Specialist — trabajaba para un tipo Monday.com, Ouyeah! , trabajaba en los 2. Me asignaron a esta startup, yo pertenecía al equipo de growth, hacíamos capacitaciónnes de OKRs, me involucraba en el equipo de Growth
Automatizaciones de Salesforce
Automations and workflow questions
When one user start the customer journey, they will know if they are accepted or not and we will put the money in their bank account. But when the users have problems with their ID, they stop engaging, we send a push to take again the photo. They only need to take again the photo. For giving a loan, the 50% of the users that we have every single day, the conversion was low. Before they start the application because they don't tack their own loan.
User install the app, starts to do a form with their data, they take a photo of credentials, our algorithm tell us if they are credit worthy or not, you need to say if you want that loan how much and for how long,… however some people don't take the photo correctly or algorithm say is credit worthy and don't click onnthe button, they don't take it, if you dontnclick. So I did an automation with a workflow if the user stay inn that step, send a message and push notification, we have 3 reminders in every single step so we don't lose they users.. before 50% of the users with that problem now 85% of the users take the money in day 0.
Proud — in case of achievements the company I am most proud is Kashin, we are profitable, we don't burn money, the thing that I am really proud they lower the acquisition in the retention, my current post of LinkedIn we have that Hookey stick. I reduced the CAC and increased the LTV, right channels, and diversificate the budget. Google Ads, Meta, TikTOk, SEO. We do social proofing — the user start talking good of us in social media platform. We do testimonials campaigns, we do those testimonials, we run campaigns, we give gift cards, give aways. The users need to send testimony and randomly we use the users who win.
Learned most was in Oh Yeah — I loved the startups, understood how startups are built, took a course, learned a lot
Salary — $4.5 —> $5.2k

_____
Hey was great chatting today!

Can you please send the response to this questions in one paragraph:
What's one thing you've built that you're most proud of?

What's your experience with SEO? Articulate, name tools and give examples.
What's a time you spotted something inefficient and you made it more better with a workflow?
_____
Fire Crawl

_____
BRENDA SOLADI BERNO — web scraper
Techstack: scrapy, playwright, pyppeteer, beautifulsoup.
Tensorflow, Pytorch, GItHub Actions,
SQL, Postgres, MySQL, MongoDB, Jenkins, Docker, AWS
Computer Science.

Master in Computer Vision — I wrote papers in Computer vision.
BitMaker -- Stella product, is a an architecture for running spiders inside there, we get clients that they need the spiders, we develop the spiders. When you run a spider in your local computer you run with a lot of problems, you only need a product from amazon, our job is to develop this code, then we can deliver to you the results of the scope, an architecture like Stella is an instance. We have in bitmaker cloud to run things and Stella is open for having it in your local servers. We have proxies companies that we use, we offer to you, you don't need to use your time, we have those options.
Scraping — products from shop sites amazon, aliexpress, shopee, then return all in the data base, update all these products every single time. Every page has different challenges. Bots, Captcha, the architecture of this project, we need to run this every hour, every two ours. The biggest challenge, Scrapy, some spiders with playwright, pyppeteer
Insurance — we had clinical cases for people, we had an API project with Django and Python, we had clinical data for the people. Then we need to process into some calculations, the returned to the client a result to that calculation depending on what they feed the model. Server. Python packages.
When I started inn BItmaker. Startup, they started to get data from some links, we returned the data from links. A product where they sold things in the deep web. They sent links where it has a list of products, we returned to the client products and more links. In was the same thing, the only challenge is that in the deep web you don't have the link. Scrapy
Huawei — more learning, culture, trip to china.
Software Engineer at Virtual Labs — Django apps — there were like APIs request, we had end points, the client wanted to get this information. We need to return to the client data from animals. Digital marketing. We had universities, etc. My role was python developer.
I like web scraping, I like to scrape websites. I know the use of the proxies, captcha solvers, playwright, the last step is the useless approach with playwright. I
SALARY: $3k-4k

_____

MANOS V __ WEBSCRAPER BELVO
TechStack: Javascrpt, React, NodeJS, MongoDB, SQL, Postgres, Terraform, Docker, AWS, GCP,
Manos Vacilas — Scrapy, aiohttp, playwright, selenium. mitmproxy
aiohttp — library in python where you make request, to create a custom framework,
mitmproxy— stands for man in the middle proxy — it tracks every request in the computer.
Terraform — automates the cloud stuff so you don't need to use much stuff of aws.
Robotic process automation — reverse ingerineeting websites.
Fuctions Health — they were calling RPA — they wanted some automation so that the users that use the website schedule medical appintments in third party websites. Do a robot in medical labs websites. It was not collecting data, it was reverse engineering the website to make the appointment. All their bots were using selenium, but it was taking like 10 minutes to do it, they replicated the whole process doing request. Selenium open the browser, and it was a waste of money, so I said we had to replicate everything with request tracking, they didn't have much protection. Built a custom framework. GCP also we have the api, the api sends a pubsub message to the scraper or the RPA bot, schedules the appointment, and the scraper sends a pubsub message to update the database.
Request library is not assyncrunus. 10 request for 5 hours.
Belvo — I worked there, it is the most difficult scraping because we had to bypass bank protection. It was difficult for me because you need to become a hacker. Most difficult part was reverse engineering, usingg tools in Linux, we were tracking, reserve engineered an android application, get the request, in the mobile apps you can't do the request, so needed to track the requests that apps were making to the web. You use Ubuntu or a desktop simulator that track the application in the computer. 10k request per hour.
Techstack:
EBO Pricing - they were doing price comparisons, and they wanted to scrape, amazon, intersports, consumer goods websites and different shopping websites // toolsgroup.com

Freelancer — I was doing web scraping in upwark, client who wanted to scrape websites of the UK. It was a private client. Scapaerd over 50 websites, it was regarding decisions of some criminal websites, juries, they were lawyers.
$4500 euros or $5200 dollars.

Miguel Reinoso — Marketing
Head of Growth & Marketing at top LatAm startups - Hapi (1.5M+ raised), Whaticket ($1M+ revenue), Mundi (USV/$125M+ raised), Crehana ($95M+)
Senior 2016
BusPortal / RedBus — started making comment for SEO, startup that was acquired by a frack guy in Peru. I started positioning information and traffic, I was one of the only marketing people. I did Ads, copywriting, campaigns, creative stuff, design thinking. Photoshop and illustrator, creative direction.
CMS — blogs Wordpress for Colombia and Peru. I hired content writers, SEO analysts, Ads people.
Crehana — Performance and marketing acquisition — negotiate with stakeholders, product people. Content creators, influencers. In Crehana we had to negotiate what content creators we would have to reccommend courses. Channel of referrals and influencers. Email marketing.
In Crehana was a different challenge every time, a lot of pressure for achieving milestones. 150k+ and after, 4x clients, we were around 2 million. Pre-pandemia February 2020- 500k and post pandemic, 2M. Growth of 30-50% month over month.
Mundi —founding performance marketing in Mundi — we opened new products. When I started was factoring to Mexican exporters and we added insurance for exporters. Para carga. My biggest challenge was having more qualified leads. In Mundi was B2B, so here was more into Hubspot. Analytics of Dashboards. I learned that we in companies we get a tool like Hubspot, there is a learning curve, 1:1 follow ups, in technical stuff people miss the opportunity to take advantage of it.
Automations in Hubspot — I built email journeys in Hubspot, we added WhatsApp as an external tool and manage them through Hubspot. The eternal fight between marketing and sales, of a qualified lead. Do surveys with better questions to analyze qualified leads. Do they interact with the content? I worked on target persona, what do they need to have? Needs to be a formal company with a target revenue and a number of clients, also taking out fraud and so on. We integrated APIs to qualify better users. I had to talk with devs to show our pain, to integrate these APIs.
Whaticket — Growth — managing all the platforms, all the KPIs, a lot of tools, metrics, and KPIs. The Head of Growth in Crehana was my mentor. I learned a lot from metrics, digital channels, pay channels like media and advertisements, I learned how to grow organic channels, ship a feature I need. How I can manage every channels.
CRM in Whatsapp — a chat platform where you can connect your platform to a web chat app, a messaging app. Before me, the marketing was managed by one of the founders, he was more an entrepreneur, so she did mostly organic traffic. I entered to specialize the area, develop other channels not just organic channels, I hired an SEO fool time. All the area was managed by freelancers, so I entered to bring into a social media person, I specialize this role so she could grow on this role getting seniority. I started my team with these profiles, so I hired some content writers and specialists, I had to grow all these channels, they didn't have data. CRM called fresh works. Clone of Hubspot. The data was stored wrongly, we didn't have metrics, I had to improve the data collection process. I built an initial dashboard, doing a CRM, the person that I found for performance marketing also did data analytics, so we did a lot of data cleaning. We went from 0 to a 100 in data insights, we realized what countries contributed the most revenue, we had retention metrics, churn. I entered to specialize all the area. Great data and insights. I like data too, so I entered into data analytics, some dashboards and some tools. This was kind of my plus and extra. We grew the acquisition. We doubled it by the end of first month, what channels are the best to invest and focus the team. What is the best channel, what drives the most revenue? What channels work well? Every month we grew 20%-3-% in revenue and acquisition of clients. The challenge was to retain the clients. So 6 month into my entrance, was more fighting with retention metric. How? What is the ideal customer, what are the characteristics of the ideal client, with this image, we could improved segmentation, messaging,

changing the pricing and products, features for different kinds of client. Best type of client. We didn't pursue just campaigns, we were more into getting users that can use more features not just the whatasapp campaign products. Some of our users were churning, because they didn't understand how to use the product. I implemented a user guiding, we made a lot of content for onboarding. We added banners, good at making campaigns like Black Friday, seasonality campaigns, that had a lot of impact in our revenue.
Hapi App — Investment company — I invest in crypto and stocks since 2020.
For me it is a great product and I have a lot of insights on how investment platforms work, for me it was a no-brainer, changing jobs from Whaticket to Hapi. Two people in the area of marketing, now we have 7 people in the area. I had to start from 0 and start hiring people in this area.
Here I am a Growth Manager, we have a CRM here that is not Hubspot. Customer.io — I can also do automations, I did it, but I have a person that specialize in the CRM. Every time I have to do the set up of the tool, given this, I delegate to the specialist in my team.
The first thing I accomplished was having a workflow recognized by the CEO as a good practice and great organized, a structure to grow and work with my team. We did a Kanban structure with a Kanban in Notion. Initially it was difficult because we had a decrease in the metrics of growth. I had two difficult months because we were in a down trend, Hapi relies a lot on influencers and content creators, we had an equilibrium in channels, we are not only dependent on one channel. There were two attached to the growth in one country. It works in every country, 70% of our growth is in Colombia and Peru, and my challenge was to distribute well the revenue in other countries, so I increased the growth in Mexico, Chile, Bolivia, the balance is as focused in one single country, we grew 30-40% and we increased some important milestones. That put us in the path of growth were investors were Hapi. I think that was a bug accomplishment.
I was a content creators myself for channels in YouTube in the past. I had a few channels. It is difficult but I have channels that still have users. The first and most important part is having engagement with content creators, you have to try a lot to reach large influencers. The best content creators to work with are the ones with less than 30k followers, they have a small audience but that audience is niche enough to have a larger influence into their audience.
Influencers managemnt — always you need a person to do the scouting, you need at least a junior intern to do the scouting, all starts with the scouting, defining what sector to search in, what are the content creators and similar content creators I want. Tier 1 is star influencers (1m), tier 2 (100k+), tier 3 (10k+), so I can create the strategies to reach them. Once I have these categories, I need to do the scouting, I like to have them in Notion to automate to send emails to the data base, create a CRM in notion with inputs, I put all in a table, then we do the contact phase to see how many of them we can schedule, interview phase, negotiation phase, rewards system, some of them work on a fee only on campaigns or refferal links, getting investors through that link. It depends on the product. I ca bring a platform for affiliate marketing. Then I have to measure these impact and these influencers. We have a referral program to track their links, customized dashboard for everyone. Motivate them to do more actions. With smaller influencers we usually set a system. The dashboard and the goal. With content we give them a lot of assets. Affiliate platform.
NEXT:
I want more freedom in decisions. I know how to do things, but on every company the founders and CEOs are to impatient and too pushy, they just want result fast. I want a context and environment where I can build the right strategy, but I really want more freedom on how to move forward with the strategy. Micromanagement usually don't go so well. That is what I am looking in terms of challenges. You put me any challenge and I will take it.

SALARY: $5k — $6k
Hapi — I don't have any perks. Stock package is not as important right now. We don't have vacations, you can take time off. Officially they don't have those dates.
Being Hands on? Would be great to be an individual contributor again, I like to be hands on, I know how to use Lovable, Bubble. I build things where I have pains.

LLMs — in Hapi the person who is doing SEO is doing it. I think they called it SAI — I like the future of SEO and sales and LLMs. I don't do technical SEO but I know how to grow a channel, when things get to technical I use freelancers and ChatGPT. When some stuff are broken because the tech team didn't consider something in a change and they broke thousands of landing pages.
English — 8-9 / 10

HAMZA ALI — web scraper — Pakistan
Tech: Python, Scapy, Django, GCP, Beautiful Soup.
Zyte — primarily in company that works with data, web scrapers. I am building e-commerce sites scrapers, Walmart, amazon, the major e-commerce websites. Deliver the data to customers. Also job posting: Glassdoor, indeed. Articles and newsletter websites. We have our internal api. College catalogue websites, to check courses and curriculum.
https://catalog.ccac.edu/preview_course_nopop.php?catoid=12&coid=22679
PDFs websites — building materials related, in the construction what materials are friendly, composition of the materials. A lot of the info was in website and also we had to scraper data from pdfs. Hundreds of pdfs and we used LLMs to get the data from PDFs. Download pdf and feed pdfs to LLM.
Scrapy gives you the flexibility. When we talk on scraping. 1 million records scrapy is better.
Arbsoft — web scraper — aggregator, integrate different apis, European client, intregrate carries into their website where users can check their journey. Website aggregator where carriers can integrate. Bus companies. I was part of the backend team, part of integrating the apis of bus companies into our platform. So the front end can use our api.
S&P — Fortune 500, it has one office in our company. Darknet tech stack. I mainly work with darknet related technilogies. They had their own framework but I worked with darknet stack mostly.
Own product — giving insights on financial data, countries ratings, logistics.
Salary: $4000+
Remote — $5k

Helder Mendes —
Prediktive — I was a backend engineer — there was a time when I led a team, the difference there is that it was a small company. Didn't have such big projects. It was more like basic where you could create an end point. Sometimes it had some interesting challenges. They use GCP not AWS. What I did was I basically replicated the GCP. They have a catalogue, equipment, construction equipment companies like Caterpillar. They served the USA and Canada. The company itself was a data company. It was basically predicting and evaluating product performance over the years. I would use the algorithm itself.
I worked for some months on the evaluation team, where I can speed the prices for the equipment , then the sales team, where we were closer to the client and the frontend.
Tech: Python, Django, FastAPI. Flask mostly. Kubernetes.
Itau - it was banking project — a requirement from the central bank that every bank needs to integrate their data. All transactions that a bank is having needs to be notified. Transactional data.
C6 Bank — Kotlin + AWS — credit and investment team — promoted to team lead on investment team, high level design, was like a social security for seniors. It is kind of a private pension. Long term investment where people could invest money. Retirement account. Didn't exist yet and I had to built it from zero. I had to do all the high level design. Layer of cash. Used redix. I built into production.
Pagar.me — operations team — my faction was more a way of automating internal workflows for the people in the company. Analyzing customers in terms of risk, acquiring type of company, money flow. I don't remember the technology of financial institutions. Between the business owner and the bank, it is called the acquirer.
Our customers were digital business owners — a 100% of them were digital — any illligal actives, I built a web scraping tool. I used two different tools. Scrapy and Selenium. The client web pages to look for illegal activities, to prevent that customer to be a threat.

Python backend, team resposinbile for delivering. POS. The delivery of this machine was orchestrated by a micro service in NodeJS.
Entrepreneur.
Digital hospital — remote assurance for doctors, they didn't want to give the patients the digital numbers… A messaging app that would connect doctors to patients, based on subscription.
Salary: $5300
Expectation: $5-6k

Kevin Shock — Manufacturing Engineer
Next — my intuition is good about companies, I am gonna be more vocal about it. Sometimes things don't make sense to me when is being done.
I wanna make something, I don't wanna go back into years long prototyping. Two years is also fine. The most fun part of my career is seeing products that are launched. Charging infra I worked on. I would like to see a prod.. I like to be ahead of the trends. So
LIlium — They were signing up suppliers for contracts that were really big in volume, industrializing these suppliers, they didn't have the money. That was kind of a bad situation if you're leading a supply chain effort and the company is gonna go bankrupt. They didn't pay the employees. Germans are amazing engineers and incredible in ability. Some much of the work they did was great and could have work if they took a different strategy.
Joby was
They were doing detail design. You don't need to order all of these materials. They had to much machineries in place. Didn't have money. The first day I arrived they were talking how they were going to run out of money. Meanwhile I was negotiating with suppliers in Germany, Spain, Austria, US suppliers. Mechanical components.
They had decided the roles too much, so responsibility is everywhere non body is accountable. I am more.. they industrialized too heavily. That is not my resposanbility. I never had that level of dialogue in a startup.
Joby — aviation — they were in low volume, their first production. Biggest bottleneck was the inverter of the manufactuing. I was on the inverter. When I joined that was the bottleneck of the manufacturer. Moved over to production. New Processes for issue resolution. Failures that were happening for the early versions. We kind of shipped it in debug mode, insure every unit was made I product design necessity. We launched a new version of the line. Led to second part was owning all the equipment that was out of that facility, small electronics, battery. Based on milestones for certification, production. Systems being developed. When I left. We scaled the work I did to other lines, we also had a streamline prioritazion process for manufacturing equipment. We could fisnihs projects at a high rate. A lot of people at Tesla, model 3, prototype part, prototype process, owned the battery enclosure, the battery pack which is the system. Moved to Rhino. Debug the capacity. Part of that team until production 10k packs per week.
That is when I joined the solar roofing. I helped with the solar roof factory, we were reservers 1000 modules of solar roofs per week.
There were very back on installation, we produced a lot of
Supercharger — pawerpack — inverter, the controller, the Tesla side controller, powerpack, most of my time I spent on supercharger, it was version 3, so we got a lot of data on field, reliability, system, failures, leading the engineering team to be part of the product.
Korea was the first market that needed the residential version, less noise, for not interfering, 90% reduction on the noise. I spent EMC chamber. Electrical noise engineer. Spent most of pandemic working with them. What is needed to be installed in Korea. Supercharger was ramping up.. they had 10 sides. 40 superchargers. 100 supercharger sites. That is a lot more. Locking the architecture.

JUAN CASAS - Full Stack Engineer
React, PostgresQL, MongoDB, AWS, GCP.
Pinterest — Kotlin and Python on the backend. Still working on Ads.

Lyft — full stack Kotlin and Python. On apps, very much for business. Any advertiser that wanted to build something in the app. Built ads product.
Hopper — I started working on the Ads team, sell campaigns and travel plans deals, 20% in some flights and that kind of things. Ad formats inside the Hopper app. New section where people could see the deals, Implement some logic on the backend. Scala (backend), Kotlin, a little of javascript for the web in angular. Dashboard where we. Had to make a section to submit new campaigns for our advertisers as it was manual work. Campaign managers web app.
Bitso — MVP for trading crypto app. It was the first time . Kotlin, Compost. I was the owner of the app. 99.95% of no bugs. Crashfreerate. I worked on another MVP which was the Bits Card. From zero to 10k users(trading).
Rappi — Mobile Engineer Android Kotlin — I was working int the operations part, maintain and implement features for shoppers when they had to buy products, choose a product, non available. Shoppers app. Checkout for shoppers.
Next: mobile and full stack —
Salary: $10k

_____

Daniel Contreras — Firmware Engineer
Firmware Embedded systems engineer — I always have been very lose to the hardware. After college I started as a hardware engineer
Wallbox — one of the main differences here, I am also focused on the firmware and I take part of the design. I am part of some of the design. EV chargers. 240 kilowatt. You can charge your car within 20 minutes. I am working on the team that implements the electronic part of the charger. I am more on the technical part. 3-4 people in this area. We have interactions with other teams. One of the differences that my current job is that there I was in direct contact with the client, come with viable solutions but here I am not in direct contact with the client, this is technically; viable or not. More than a month and ahlaf ago I joined another team, it was a big team. They needed support. I am doing support for the automation team. Prepare and program in-house built systems that test the chargers, simulation, automation. I am in the team that sign programs and automatic systems. Car simulations. We provide this system.
Firmware part — charge of the firmware, I worked mainly with microcontrollers, controlling memory, chips. I don't have experience with high levelstuff like the screens or UI graphical interfaces.
IDNEO (like Silicon Gears in Barcelona similar) — electronic controller units for vehicles. Basically electronic system for vehicles. They do some parts of the product, like a sub contractor. They are very diverse. They control pressure and temperature. Control different parts of the car. Renault. Solar roof tech.
Test circuits, I wasn't designing them, I was revieing. Firmware, low level microcontroller implementation. Modeling for some parts of the application parts. While I was working for Silicon Gears, which is a classic automotive company. Autotmotive architecture for the software and electronics that go within the car. High level tools. Setting the tools.
Josemar - battery management systems for electric vehicles. A BMS, when we talk about batteries, you really have to build a system that is intelligent enough to manage all, temperatures, etc, bms is s dedicated electronics circuits that take care of all of that. Make sure that the health of the system is stable, last a lot of years.
Program them low level, microcontroller level, I wanted to keep growing.
8/10 go getter loves challenges. Very engineer.
Salary: $55k euros. Looking for more.
USA:
Open to move to the usa
Has children so would need to be stable.

_____

Ibrahim Farhan — full stack engineer
High level backend development

MInut — NOdejs, MongoDb, React on the frontend.
Backend development — we provide on top of that product are kind of diverse. Payment and suscription integrations. Marketing and sales. In the begginign I was involved with more of the domains like integrations with property management system, analyzing data and providing data from the devices. Payment integrations.
Integration with the device? It is kind of starch forward. We take the data from the device and we take that data and make some actions based on that.
Web app — yes, not directly tho, but I have done some things. We have dedicated.
Ability for the device to integrate with a property management system. WE offer a lot of integrations with these, their own APIs. Integrations. Integrate with Google Nest. Smart locks.
Working with hardware — how the devices operated, limitations, how can you connect, are you gonna allow to have communications directly, are you gonna allow 2 side communication or just one way. The device doesn't take much consumption. What happens when the device scenarios. Notifications when the device is not behaving well. How often we want this communication to be. What is the business requirements and what we want the device to do.
Backend:
FIXED SOLUTIONS —
We take resposanbiliities of deploying the backend. Kubernetes. Cloud. Mainly I take part in this monitoring and backend, doing deployment, releases, air logging, monitoring the health and performance of the app in the backend.
In my previous company we had a low code developement platform to build the requirements of the business. Increasing the features. Build governmental services.
Cybersecurity, it began as a cybersecurity, but now it is working on the digital transformation domain. Mostly on the government, making systems digital. Creating apps for government. Minister of Electricity. Features, we make it better to deploy, payment services as well.
Visa: US Tourist visa NO — I would need a visa.
Remote: Salary:
Relocation — consider it

_____
Marcelo Diez — web scraper —
ETL — extract, transform, lead data.
Pragma — data pipelines. Usingg tools like aws. PySpark, SQL. I automate deployments with Azure.
IMy customer is Nequi — the challenge is to create a feauture in the application, that allows users to see … match specific needs. If someone buys shoes, the nequi app, if you want to buy a shoe or a shirt, detect what store is close to you. Design and develop this feature using ETLs,process, and transform information into the data bases.
Ubits — AWS, a lot of services, lambdas, I have experiences, I know about azure devops, but I prefer aws.
It is a platform like Netflix but about courses. Udemy courser, the challenge was to create a system. Recommend courses depending of preferences. Manage data quickly. Many data. Making sure the data was handle correctly. PySpark was used to handle big amounts of data.
Techstack: AWS, Python, PySpark, ETLs, Python and SQL, I have had challenges in my career. Challenges, I have worked in NEquik,
Bancolombia, Ecopetrol, I know how to use WEbscraping, I have use Selenium and Beautiful Soup. The idea was to collect info from a lot of pages, because in the moment it was important to get info from financial people. Save it in the data base and after that the idea is getting info to make decisions to know if a person is good to lend money. In this case, the idea is to take info from Dian, Government, Public information in the internet. We can get info and save it into our data bases.
It was in Bancolombia. In Ubits and Pragma I consume APIs.
Salary: $2.5k -> $3.5k
Ingles: 5/10

_____

Gustavo Adolfo — frontend developer — full stack + web scraper
Techstack: React, NodeJS, Nest, Express, Python, Django, FastAPI, Oracle, PostgressQL, MYSQL, MongoDB. A little knowledge of AWS, S3. Azure.
Moble: React Native
AB INBEV — I am building a project to the predictive area. The lost money. Tracking the money. This app has different modules to show different data that is represented as money. The user with the data, what different products needs to buy.
Develop App — scrape a police page to get information, finally reflect the data at the data base. Get information about different real estate websites. Metro cuadrado, Finca Raiz, Etc. We were implementing AI download the necessary data to get info and Ai to have the possibility to predict, for example, if a user wants to search an apartment close to the sea, then return results.
No muy bueno, muy junior.
English 6/10
Salary: $4.5 million pesos
I want $1.5k - $2.5k

Cicero Filho — Web Scraping
Grupo Taking — RPA processes — automation for some processes.
Basically the idea was to develop an automation to a process they had. Consultant. The client was Livelo, a company that is a rewards platform,I developed an automation to deal with the campaigns so it can done by a person not a robot. There are clients of companies that sell things and use rewards to bring into customers, provide more rewards for products.
Intelivix —
Company that scrapes legal processes for some clients, one is telco Claro, Latam Airlines, who is prosecuting them? Who is sueing them? IF they don't know about these process they loose. Scrape data from courts that have data available. They had other initiatives too.
How many bots? More than 100.
The courts in Brazil don't have a similarr system, some were complex, some were easy. I had to come into problems a lot of times. Captcha. Proxies. Some websites had obfuscated requests; which means they hide the content so you couldn't replicate with the scraper.
I still use the Scrapy framework, but the way that we used is we had an orchestrator called Webshooter, it is a solution that the company developed in Django to handle scrapers. I worked on the web shooter service but I didn't build it but I learned how orchsatatiors work.
JuridicoAI — I also worked with another company that scrape jurisprudences to train their AI models, I developed all the architecture of the project — I — I was hired, I am still working at them.
Also worked with other enterprises, Ive developed web scrapers to scrape legal processes here at Brazil.
Salary:
$12000 reais — $2 dollars.
Very good

Marcelo Rodrigo Andriolli — web scraper
Techstack: Python, Django, Flask, Selenium, Script, Beautiful Soup,
Python with AWS
Synthetic and data automation platform TestBox — automate the trial and sandbox environments. Api limits, logging stuff from google logging. Now I am scraping. Create demo environments. Our customers don't have any open API to do, put their data inside their platform to show their software features. We do it to automate this environment, if you're a sailor, for a SaaS, and you potentially lead to test your software. You have to reach out people from the dev team to give you a trial account. But it is hard for the company to do it because they may not know how to do it. Sandbox do it as a service, we configure a trial, we generate data. In the team I am working just in this data in customers platform. Web scraping their platform and using your internal APIs to do it and so browser automation.

Automate scraping. If I have a list of clients, I read this file, I reverse engineer how the platform works with internal apis.
I am doing reverse engineering writing python, requests to log in and insert data.
Hiverlocity — building apis for their products. Flange — Flask with Django. Structured our flask app with Django.
Triller — I have been working with Django. US Tik Tok — CMS was using to manage —
Beemon — Working as a Python developer for 10 years, web developer with experience with web scraping. I have webscraped government sites for traffic tickets infractions, from cars, trucks, and so on. There is a lot of mechanism that avoids to do web scraping. Proxies. 9 month. At the same time of stuff, trackingg
Pague Verde — CTO — it was small startup, I was a co-founder, web scraping power suppliers to get data from energy compsumption, challenging. Proxies, IP, captcha.
Salary: $5k
Get CV and whatsappp

Gaspar Neto — backend / infrastructure / python / TypeScript. React.
Curabase — clinical trial software — Pure Python and Lambda Function — App itself is on TypeScript — manage clinical trials in s decentralized way. Application helps. Pharmaceutical companies. I started as full stack engineer, now I am backend and infra wok.
Platform — very small team in the platform, a do backend work, last week I was working on a feature. Pharmaceutical company, data of the participants on a certain way. Data export, not escalationg, did from scratch to export data quickly, get data and form a pdf and get the user export it.
On the Infraside I helped bring part of the app to Kubernetes.
I helped built some integrations using lambda functions and python, also payment systems with JP morgan.
Puppeteer — grab a html and export it in a pdf format. Also to generate the pdf.
VOXY — English learning platform — python backend: Django, Django Rest, Fast Api — I worked on a legacy app that was a dashboard for staff users to gather info for the students. Another one was project that I created from scratch, Python with Fastapi, content creations, image and create content for activities, a content creator engine.
Bravi - software house — worked in companies — fast api, java,
Justice Facil — web scraping — everything in Python, a huge web crawler that extracts info from courts in Brazil. From processes that are running. Python, Django, Django Rest, Scrapy, pure python to create the APIs. Framework of crawler. Selenium. Puppeteer.
Web Scraping — I learned a lot, now I grab info a I do integrations.
Salary: $8.5k -

MARIO CARVALHO — TOP WEB SCRAPER
Started as an automation engineer
Techstack: requests, beautiful soup, cloud scraper, to bypass cloud fare protection, Playwright, Scrapy (but too complex for what we needed). We also used some captcha solvers. deathbycaptcha
GEP — it is the same process.
Stack — hire people to do services in other companies inside Brazil. — GEP Costdriverss — Leading Platform for Cost Management in Procurement — they sell data about rises an index. They understand prices and index pricing. We extract all data to set pricing to show if it good to bad moment to but their products.
I started there where we had nothing, I had to build some templates, they were stealing data manually and we automated, from countries like Brazil, latam in general, usa, Europe. From all industries, food, taxes, government information. In the USA: FRED and BLS. Extract all kind of data in from pdfs, html, excel, power bi when they had, cvs files. More than 50 web scrapers.
They gave some reviews of how they get the data,.. and then I need to automate it, video with the instructions, 100 columns, then we extract the data. Manage the team. Technical issues.

Techstack: requests, beautiful soup, cloud scraper, to bypass cloud fare protection, Playwright, Scrapy (but too complex for what we needed). We also used some captcha solvers. deathbycaptcha
Ambev — I was hired as an automation controller engineer, not working with the machine but with the data, even generate the data, all the process to generate solutions, dashboard with data. \
GC Automation — when you have a factory, you have controllers that control the machine, program devices.
Salary: 50000 reais. $3k

GIRISH NAKHUA — Head of Procurement.
LILIUM — it felt awesome. It was a super net positive experience for me. Head of Procurement for Propulsion and Flight Control System. My job was to make sure that the design being made, follow up with supplier manager, contracting side of the business.
Minimum procurement side by 2027. 40-45 packages with my team, machine components, electromechanics. I was procuring all over the place. Initially in Germany. Italy to Switzerland. I knew what I can do, India and United States. IP sensitive, so we decided not to buy from China.
How I found the suppliers? Industry knowledge. You have to the basic and use common sense to work with them, if they are a right partner for us or not. Not to hammer. Try to understand if the supplier can add value. They can be a great partner a grow? I don't pretend that my team and my employers is the best. Understand that some stuff are not negotiable. Some parameters have flexibility and some not.
Aviation is a small world — I can't find 200 factories, it is not a t-shirt.
What wouldn't you do again? Don't take anything from granted. Collaboration is the most important. Other companies have process almost down to perfection. At Llilium we were not building the jet but the company at the same time. How can I make my team better? I would take this and apply it.
Team Spirit — Lilium was moving at light speed. Day after priority is something else. That makes difficult to keep motivation as priorities change.
I had to bridge the gap. Young and experienced people together.
Safran Electrical — Rotating equipment, electronics, electric motors, electromechanical, power distribution. AIrforce one, Helicopter. Auxiliary Power Units, APUs. Motors as well.
I was lucky enough to be promoted. I grew through the ranks, I ended up becoming head of procurement to the end. Managing the supplier risk. MPR. I was leading the motor.
UK — Honda — looking to reduce cost, engine prodUrement force Honda Civic. The engine was made by UK and India. Some of the manufacturing were done in India and UK>
Then I was in the CRV team —
European was not making much mone
I am a thinker at the end
MS. International Business in UK
Education — BS Physics
Next: wearable and data analytics is at the cutting edge. Agents for procurement. Do the supplier sorting for me.
Relocation — I was in SF in November. I was in San Jose.
British Citizen — I can travel the USA for work but I cannot work in the usa.
Salary:

RICARDO RAMOS — LILIUM — MANUFACTURING LEAD
Startups is not for every body. Startups are very rewarding.
I studied in Venezuela. Idid my internship in Europe, in Spain. At some point I went to the USA to study. In Venezuela I had my own company, installation of thermal equipment for industrial and residential application, fridges and airconditioners. I decided to go to Germany. I Germany I decided to learn German. MBA in Berlin. When I finished my second year I did my internship.

Airbus — P3 Group is a consultant company for aerospace — I was working with Premium Aerotech is a T1 company, they make the fuselage for airbus — Technical PM of the concession process 350 airbus, all the mistakes and errors that are happening in the aircraft to get approved.
Altran — Production Program Coordinator — I felt a bit out of place, in these companies people don't work extra hours, this is when I got approach by Altran, my business case ws to convince Llilium that they could work with me. I Germany you are allowed to as an external 1.5 year. For th e first year I was working as a production coordinator, an end to end for different systems. I was responsible for finding suppliers, all the way until the parts were installed in the aircraft. All these process, all the way until the parts were installed in the aircraft. Later, in this time I was also part and responsible of three different systems. Later I was mostly working on the batteries. In the second phase when we needed to produce a second aircraft, we needed an assembly line leader. Production is mostly the guy who see everybody is doing. Manufacturing is how everything needs to be assembled.
We finish the production of the second generation of the batteries. Started production, Lilium start working like crazy, start hiring people like crazy. We were over 1100 people. When the structure was happening. I started working for the equipment team. We were able to write specicications, all the way to bring the equipment in house, deployed until production.
Assembly line — help the blue collar guys on the assembly of the batteries. From the very beginning…. Until it was flying. I developed the welding process and welding process. A welding woman arrived 5:30 in the morning and I then joined the other team at 8 or 9.
The first prototype burned, because a design error, as it was brought to the physical limit (Phoenix 1) — here I did revision one and two — There were many problems, when you are producing an aircraft there is many regulations but because we were in the prototyping phase we skip a lot of norms and regulations and standards. Imagine that you have the first connectors that you have in the battery were very thin so didn't stand resistant welding, and when you were welding them they failed as they burned. The welding process was not a problem but all the things from the design perspective, like electric and higher voltage systems were to the limit, also systems connecting to each other you couldn't see if the component was not connected in the socket. So lack of communication between the design and manufacturing departments. We need to have better connection between design and manufacturing.
Phoenix 2 — was supposed to have the same batteries but because the failure was in the batteries there was a campaign to redesign the batteries, I went to the help with the batteries. We redesign batteries. We started the new test campaign with new batteries, and then I Could focus on production.
Pegasus (aircraft prototype for serious production) — We were creating this to demostrate the capabilities of the aircraft. I was on the equipment team, I started specializing in the equipment. Batteries and the final assembly. I was a technical lead for the test equipment for these assembly line.
Then LIlium had another strucuturation. I was appointed engineering manager. Production testing team, I was the head of the industrial engineering team. Production test engineering team and the whole Industrial Engineering Team — includes maintenance , facilities, industrial engineering and equipment team.
Procurement ? Part of my job was to manage suppliers, suppliers from Germany but external. Test bench, over 900 volts and they were to test the batteries. Beginning of the line, in line and end of the line test. Doing electrical test. Final assembly, avionics, hydraulic systems. We were receiving the requirements and test bench that we needed for those. Test benches to the propulsion system.
Wearable devices — Cameras, niggles, vision systems, communication systems. I was thinking on making batteries for these kind of systems, everyone is making their own systems with their own batteries. Maybe the military do their own batteries but for

---

Rene Quinones — PYTHON
Scraper — AWS — I grab an LLM, Meta Llm, put it on a bucket, S2 unit, GPU, uses the LLM, the scraper goes into the page, grabs the content, and grabs the content from the page.
The project right now is an app for recreational vehicles in the USA, they go in camps in the USA, we are building a collection of camp grounds in the USA so we are scraping similar companies or

government instituions with that info, we scrap, and then we enrich the data. Instead of using a commercial LLM we mounted a LLM in AWS, we use that Llm as a tool for the scraper, the scraper goes to a page, it goes , we need a json from this data.
Enriching: The basic data don't contain enough details about campgrounds, there are company that have those details but they charge for those details, so we enrich it. We pull all the data and we compare it with our tables to enrich it. Recreation.gov.
Difficulty: the scraper is an AI tool that doesn't get detected. But we still have a IT address rotator in case we get blocked. We've done some testing from the scraping. We have a site very high quality where we run our data.
Pharmaceutical company — scrape the server of a company that do some cancer research, the people designed the server in a way that wasn't possible because they wanted to make money.
A company invest in data and they put in online but they want to sell the data, some company wants to get the data for free. They don't want you to have that data for you. Libraries like beautiful soup work less and less and less. It has been crazy todo web scraping because AI has done it easier. Today will LLMs is harder to stop the scraping process.
Django — most for projects that already exist. They need maintenance and technical debt, the code from Django. Python 0.7 to 3x. \
Baires — I worked for a company that was doing AI in Europe. INfrasCloud. This gy=uy who is the owner used to work for SIEMENS, offering a tool RAG — they give the user a template in a Browser and depending of the area of the company it releases a different template and there are surveys of the projects they are working on. What is the target audience, what is the product. What techs are you using, what materials, they send the request to the LLM, on the backend there is a enrichment to the LLM, they do a response and do a quality assurance for the response basedon that.
AIrfilters — FilterBY — they send a100 million dollars a year, they do air filters for commercial buildings, they make the money mostly for hotels. Data base, debugging and created a feature on micro service, they have a user app and user tables. They needed to have unify data, they had problems finding user information, if you have a high quality micro service, you can see the service in the admin very nice
Arkano — Pharmaceutal company — MegaLabs —
MDI — They told me for a project and they extended more and more. Curotech. —
Salary: $5k+

_____

Andre Pereira — Python
2020 — PHP and NodeJS backend position. Python and Rust and 2022.
BRQ — Machine Learning Engineer. Build infrastructure.
JUIT — web scraping — SaaS that help lawyers in Brazil with some insights, micro services using python to get data from courts in Brazil, resume, process, briefings, so the lawyers can query some words and get some data about the process involved. Help lawyers to make insights.
Selecralx, selenium, python, beautiful soup.
Neoway — it is part of B3, stocks exchange in Brazil, Neo provides solutions by selling data.
Objective: Transportation and education — the government has to control this kind of control this kind of vehicles, we have individual transportation, people that have, get a license to the government, sell transpiration. Companies several trucks, the government. Some companies need this kind of infuriation. For example, the number of trucks per state in Brazil, the concentration, we have more individual peple with trucks or companies, what kind of companies.
Scrapy, I have to bypass captchas, use residential proxies, depends on the source and context.
Invista — we had a team of lawyer and investors. In Brazil we have some kind of funding for people who have no credit. Help the lawyers find irregularities from people that need credits. In this project, the main goal for me was to gather information about some several sources. Identity, background records, financial background records.
Beautiful Soup, selectolax, selenium, scrapy,

AI Solutions — It was my first project that I worked in data role in Python. It was my first in data. I had to work with ETL process, ML, extraction. It was a good project because I learned a lot in the process. Public sector — it was a project where I got some data from web scraping but I got the data, I didn't scrape it, I just got it. Data like html, json, put this data in a json, mongo db. Apply this transformation, made classification in the data to understand and search more about the … the goal of the project was to make auditory.. help gov team to search about the data and make some problems about corruption. Accountability project. What data? The contracts, all the public sector needs to post info in a portal, but they don't talk about this data or use it for compliance. Help analyze the data.
Not as articulated.
Salary: $25000 — $3k dollars
I am looking for $4k dollars.

_____

Cesar Andres Gomez — Software Developer — Full Stack
Pineapple - it was software factory — what I did was building on React, Node, MongoDB, monolithic approach. Aws.
EPAM _
TV Company — VIZIO — https://www.vizio.com/en/home — what I have done is spinning up new applications for the tvs, using node js, was, lambdas, using internal frameworks, a lot of enterprise experience. Working with TVs. The application in the tv, the backend.

First Client was a Candidate Tracking System https://www.lever.co — we used to an internal framework on javascript, we were the only ones using that framework. Postgres, SQL, AWS, using buckets to trigger lambdas. I added multiple features like a new text editor, it was when you want to send an email to a web page, the text editor sometimes are messy. Internal features such as improving how see candidates, how to do job posting, I did changes on the DevOps part. We want to speed a new service to machines. —— Level was acquired.
Mochi Health — https://joinmochi.com — a manufacturing company that wanted to track the inventory so people in stores can track the inventory, this was sold, or this hasn't been sold everything that has to do with inventory tracking and management. This was for medical devices, like ambulance devices, the things that they get you X ray. We need to track the money.
Amazon Seller — Inventory Product — we. Had to connect all data from inventory.
Neolinux -- I wanted to jump into bigger projects. Everyone was launching a startup. Wordpress e-commerce for doctors, local stores, etc
React Native — Gamification — 100 users in 2 months. I did some bad things. — lets say that user wants to make money, the offer of the application was to do small task to make money. Amazon machine turk — it was basically a competition to that through gamification, It did streamy well, I did 2000 dollars in the first couple of months.
Salary: $5k —> $6k
Next: I am tired of the enterprise environment, I have always like startups. I don't like so many layers of management. I don't want to do minimal changes. I want to come up with new ideas.

_____

SEBASTIAN RODRIGUEZ — FULL STACK
Treble AI — Full Stack — React + Python + Lambdas microservices. Clickhouse. Langchain. We are trying to integrate Langchain. We have a ton of files and we need a good vector database.
I am building a WhatsApp agent. We are using WhatsApp to talk with customers and CRMs.
We are connecting clients with leads, we are integrating agents with specific knowledge stacks with each client, each agent has their own data so we automate things they couldn't do.
Genius Sports — This was a challenge, because they are a UK company and there — we were distributing the NFL in low latency for different projects. We distributed the NFL in Las Vegas, Canada, Mexico. It is kind of a Netflix, but we distribute to Netflix or different.
I was in two projects, first, I was building the backend part for creating the infrastructure open the demand for creating the pipelines to distribute the video. The idea was to create pipelines on demand

to send that string to a CRM, CRM see the command and it was in charge of distribution. Kotlin, GrapghQL, Postgres, Kubernetes, S2. HTTP logs, we collect them, per one minute. Of consumption, video is delivering in packages, a small change of the video. Snowflake.
Second, a lot of people uses streaming, and specifically NFL, the consumption was huge. We had alot of data without transformation. Forgetting metrics, delivering metrics for our customers. Mostly building the designing of transformation pipelines.
GODadddy — I was working in a contractor project — create new features for the inventory catalogue, the ideas was mostly adding features, my project was to improve the inventory part, improving efficiency, improving the code, mostly Golang, AWS Lambdas,
When you are looking for a domain, GODaddy use that info to seeif there is availability for that specific address, improving the low.
RAPPI — Restaurant app — recovering — the problem was that restaurants couldn't manage the management menu properly. Updating the menu, handling different parts of the menu was difficult for them. I had to redesign the code, I had to use graph theory, mix of relational and non relational databsse, relational for the transactions and non relational for the menu. There was performance issue, for example, a usual menu has 200 or 300 items, something you can save or add in an order, so if somebody wants to change something in the order it was a mess. Etch: java with micro services, Postgres's, react, some events in Kafka, Mongo, AWS. Mostly backend.
Salary —$7k for a change ->
Founder type!!!!!!!!!!!!!!!!!!!

_____
Abijith —
I started
PEtro — Kuwait — quality inspector there, manufacturing
Dyson — Senior Manufacturing Engineer — they decided to stop the battery project and it was let go. I was living in Singapore. I was supporting the battery manufacturing for Dyson, I was in charge of the Formation Process, where the battery is attached, is the process where the battery comes to life. Before the formation process you just have the materials. I get the battery in the battery form, for you to use it you need to make charges and discharge, for it to start working. Before it is just raw materials and at the end it is a battery which can give a voltage.
I was working with the development team, developing the formation process. They decided. Initially the battery for the vacuum cleaner. It was planned to produce about 15k batteries.
Collins Aerospace — as a manufacturing engineer I was responsible of the testing and =manufacturing, electronic components that goes into the engine of the aircraft. I was basically working on assembly and testing. I used the daily manufacturing. I was in charge of 5 product lanes. New product - transfer out from our customer side in the USA. I was working in the team to set up the whole production flow, secondary control electronic unit, this is the electronic component which provides the trust for the take off and steering. Electronic unit that transfer the signal to the physical component. Equipments, I was also involved in sourcing of equipments. We try to assimilate the flight conditions, I did the testing. We put the unit in thermal chamber and also vibration. Sourcing the test chamber.
Collins I was taking care of different 20-25, 70-80 numbers per month.
Up to move to anywhere in the world.
Salary — $120k / year

_____
MARCO CIUFFREDA
Vay — it is a car sharing, via remote driving, the supply chain logistics, building a global supply chain.
Lilium — electrical components supply chain, battery components. Electric suppliers. Making sure the supply chain is resilient, inspecting suppliers, building the first prototypes. After this experience, responsible for procurement. Developing the supply chain, designing processs.
Larboguini — I was responsible for the quality department. Validating components, integrating the components. I was leading all this activity, making sure that the suppliers were validated. That they

were doing quality products. Mechanical, Electric, Plastic, Leather. I was the main interface for production, providing, parts, the daily plan for the manufacturing of the vehicles. End to end project for quality at the industrialization perspective. My responsibility grew over time. I was resposadible for the connectivity, testing and releasing to customers.
GM — Designing components and validating components. For engines. 700k per year.1 150k engines. The components that I was making were like 3-4 per engine. Components for engines, mechanical parts. Actuators. Electrical parts.
In all those experiences, my first customer is the production, I need to know what are the requirements, technical features, general requirements, what can be achieved from supply chain perspective. IN Lamborghini I was responsible for making sure production happens. The requirements we put in suppliers may impact the customers as well.
Salary: $110k euros — USA specially SF is quite a different story.
Relocation: yes — I can travel as a tourist I can get to USA, take 3 days to get approved.

_____

PRADEEP Pulipaka — MANUFACTURING Engineer
Manufacturing Engineer —
Lilium — I was looking for a change, found them in TechCrunch and I applied. Even before talking to me, he was looking into AI startups.
I started as a Manufacturing Engineer — I was building prototype of batteries. Building batteries assemblies. Prototypes, Phoenix, and also the Prototype that was 90% before the insolvency. Battery pack I was working on it.
Aircraft integrations — avionics, electrical wirings into the aircraft, the wings and landing installation. I had a team of manufacturing. Half product development and half day to day production. How many? Two prototypes. 2 Phoenix and 2 Pegasus
Design and product
Reason for not mass manufacturing — cash and other things. How to make ti successful: cash managed better. Sometimes is the technology and regulation.
Interactive ai with old people — robot speaking to them —
Volvo — Manufacturing Engineer — I was setting up the company process and production line, we had many issues because it was anew product. Volvo volvo commercial vehicles , FM FMX FH — we were producing 25-30/day. Cabin assembly. End to end, setting up the tools, the assembly line, lane balancing, how many technicians, doing root cause analysis, also using systems to eliminate waste in production, six sigma. I moved on the factory for 3 years.
Then PM role, to design, how to reduce, if there is a simple bracket. Snap it, I was proposing to the engineering team to reduce time in the production. I spent a couple od days in the factory take inputs and come back. You propose a design so you evaluate if it is working well.

_____

NICOLAS VALDERRAMA — WEB SCRAPING
Truora — here I work more in backend, scraping was not my main job. There are other teams that work with data scraping from government data bases, and to them we address issues regarding to security. We use proxies to by pass security. I haven't built the scrapers, that is a responsibility of another team, my team is gonna be part of that team, developing new bots.
I saw the code, and when something is broken I try to fix. In the team that I work I need to integrate to those data sources.
Team — I am in charge of all digital identity validation, biometric, document validation, face analysis, email, phone. I am building all the infra for validations. The master we must develop for is document validation, because we validate documents to 10-15 countries, each country has different documents. ID cards. It is uses for id validation, you do it from your phone, you take a selfie, we validate that is a trust worthy document.
We host the whole infra, I am in charge of e=thewhole development lifecycle, if I propose a new feature I have to develop the architecture, I am in charge of how it will scale. How we will support the services.

Techstack: Go, golang, AWS, Terraform, ViewJS. Python? Analysis models that are wtirrenin Python.
National University of Colombia — Project from data science professor where we collected all the papers from professors from the university from websites through scrapers, to check the research capacity of the university. — https://horus.unal.edu.co — we needed to do bots from each source of information. We had a specialize data collection from each page. There weren't too many, Id say 3 or 4, it was more like a constant development and support. I developed 2 or 3 more. Techstack: Selenium, Python.
Salary: $7 million pesos - I would like to receive 10million to 12 million pesos. I would enjoy a lot doing scraping. I would enjoy a lot, I learn very fast, but I think I would perform better on a backend job. My current job is on backend. It is kind of obvious.

Anand Suresh — SEWTS
Textile Automation — Making Robotics solutions for commercial laundries — The first product that raised the series A, there are people that feed the washing machine, robots that does that.
Ecommerce returns, huuse returns, automotive industry. Robot for material manipleasing in manufacturing. So lets say in automotive industry you need to ick up a screw, easy to manipulate that, but with textiles it is harder to manuplate that. You need ai computer vision, play with hardware and make it manuplate that.
Lead and manage the product team — what I do now I am the lead roboticist, the lead the developer and product owner. I do technical development, coordinating hardware, electronics, software, the bridge between startegy and development. We have suppliers, I deal with them. Depends on what part are you building. The robotics solution have PLC, if we want to manufacture machine components all of that needs to be coordinated.
I started in India — Bachelor, I worked on Robotics startups.
Postdoctoral Researcher — Robotics, industry robotics, robotic arms, research group leader. Munich - I was the Robotic Research Group Leader for 6 years.
Then I built humanoid robots in the PhD thesis in the Institute Italano di Tecnologia, building Humanoid Robots. ICUB3 Robot - ICUBR1
ExoTool — Robot for companies here — hilti — They are construction companies, I built a first version of that tool. They take your muscular data. Musle damage. We built this prototypes and gave it to the companies. Big Vision of what should we build, 30% of that vision.
Aldabaran Robotics — Aldabaran Paper, both by Softbank Robotics — I built the Hands of the Robot. I worked for the mechatronics team for Softbank robotics.
Then I went to Poland to study Robotics, Information and
PurpleLeap — education spin off, book manufacturing company, education and engineering books. Basically developed the robotic materials that come with the books. Built robots. Deploy them. The whole thing from design to production. Team of 8 people. Manufacture everything. Take it to universities, deploy it. 5 robots per team. 10 robots per package.
200 per month. — purple leap bought RObhotah
Robhatah Robotics — built a humanoids, football robots that could be used in compoetitions. How many produced? 200 units / month to different universities. Very basic ones.
The prototypes were built in house, then you pass it to the manufacturer and suppliers, they did quality control and assembly.

AAYUSH GALA — PYTHON Engineer —
Techstack: Python, Django, FastAPI, PySpark, MySQL, SQL, Postgres, Mongo, Langchain, AWS.
Data when we get it from Rappi, SKU, it is not accurate, we have access, gemini access, they have predefined gems, you are trained to be the person who handle the supply chain. We have trained Gemini, Gemini Gems. You are a supply chain manager, you manage the supply of products, we call an API to know how many products, everyone data is inaccurate. Get correct numbers. You need to know the expiring data of this product. How does Gemini — shelf date, how many days you can use it. I am calling the API.

I am using Copilot. Another thing which I haven't done is extracting data from video. I am working on an MCP, upload a video, that particular video has a person scrolling from some data in a website and extracts data from that. I wanted to explore how MCP works. There is not need but I wanted to understand how works. Calling Gemini, to help with data, integrate that with Claude, and in the backend it calls Gemini API to get that data.
Fountain9 (YC W21) — it helps 4 companies manage inventory data. Cosmetic company.
Mainly focused on inventory management, in big level. Rappi has Rappi Tubo so we managed Rappi Tubo inventory. I was building the whole processing for them for iNventory Management. If Rappi was gonna sell 10 million units, there is always . Inventory modules.
8th employee. Inventory Management — just having focus doesn't help, what Rappi needs if you are gonna sell something you need to plan how many units to buy to be able to supply demand. Always there is errors or surprises. You can't miss out stock for coke, because when you order something you also ask for something else. If there is out of stock you will miss a whole order. Optimizing how many things you have. There is also wait times for orders, because suppliers also delay depending on how many units. So you need to weight all of that. They have a warehouse.
Techstack: Python, Django, SQL, Postgres, Mongo, pg_vector.
We have been exploring LangChain — Postgres, I love it a lot. PG
Capgemini — Python, PySpark, biodata, ETL process.
Built a tool based on Python, we were using Django. We were doing all transformation of data. Data migration, Johnson and Johnson, they wanted to migrate from Postgres to Snowflake. They wanted to solve their issue of scale and build reporting on top of that data. I helped built a tool for that migration.

ANDY KERR
Northvolt
Manufacturing Tractors — product development, feasibility, design, engineering, aerospace, batteries manufacturing.
Digital flow, digital flow, operational impact, design to target, cost engineering.
I look at global standards, how to deploy, how the data is managed, look at data manipulate it, add value to the operations and manufacturing, you need data but if you don't use it… I am practically; in terms of being hands on.
I am a process expert, looking at process, how to industrialize process. Design operations. Design for manufacturing, to make it successful. A lot of failure is on the manufacturing set up, they focus on the wrong things, they over complicate.
NOtthvold — global standards, design engineering construction, manufacturing engineering standard, infra and hardware, also comisoining both factory and equipment. Standard.
50 giga per hour - cell design for the customer
Lucid Motors — Global Manufacturing, the gravity, next generation vehicles in terms of design of factory in Sauidi Arabia. Factory design, technical integration of process and product. Baseline of development. Global manufacturing, we have the program for electric vehicles in Saudi Arabia. They are building designing, integrating the process,
150000 units per year. Body assembly, in Saudi Arabia.. Slovakia 150k and the planned was developed to be double.
Lilium — one was supply chain operations, fix a team on electric propulsion system. I did it for 8 months, I did that in parallel. I took the manufacturing in terms of industrialization, process equipment. Working with engineering designer, technical equipment, factory design, cleanroom set up. I was also looking for the supply chain management in terms of the suppliers.
Jaguar —
BMW — That was one car a minute
Tata — main role, I was chief engineer in the UK technical center, new project engineering for new vehicles, light commercial. In India I was also resposanble for prototyping. The prototype 350 cars in a year. The motors, I was responsible for the car in the shop to make them in that arena.
Accuride — 1200 per day — I designed the testing all the methodology, integrations, I

Biggest foundamental — innovation in stables companies are difficult to implement and adopt.
IN Land Rover I was showing how to electrify at slower rate and build different industrial engine, and switch over. That was ahead of the time, the local plan director remove it because you don't need it.
The control of the process is super important. There is lots of innovation but there is a lack of control on terms of how to industrialize, not understanding financial runways, not being able to have the right people at the right process and the right time. Vulture, expanding growth, people in the wrong roles. They are super intelligent people but they aren't in the right roles at the right time, how to scale from a startup perspective. Go big but that is not e right way to scale. Going fast in the begging is not the best, better to be slow at the beginning so you don't miss a lot of planning in the end. You see that very commonly
Tesla Effect — they don't apply in the same way, so they go quick but they don't do the planning correctly. NOrthvolt were struggling with capacity and production, they had problems with factory design, integrations and so on, they wanted to open more factories the same time.
You cannot do it that way, what is the focus? Cost? Going quick? Output of going quick with a huge cost, so you cannot value engineer that quantity, they are over budget. Rather than designing for target, affordability, design for operations. How do I run my manufacturing plant? If you are trying to produce a product, you are a manufacturing startup. You have to have that in your mind.
Manufacturing people — manufacturing centric leader, a chief manufacturing and very manufacruting officer. Focus on the operational elements of the industrialization. You are not doing feasibility. Someone in manufacturing experience, more tangible as you get further down. You can have a consultant too.
Take the lucid car — Beautifully crafted, the lucid car. Same with automations — if you over automate, you can destroy the process flow. That is the risk of automation. I don't know but other airports, the airport of Sweden have automated the scanning of the bags, when you introduce that the scanning process is slower, reject more bags, so it takes longer, last time I took me 5x times, because the scanner didn't work. They automated the wrong thing.
Personal Preference — as soon as possible, because if you go late a lot of the damage is done, so you can have an impact on being on a position where you industrialize something that doesn't make sense. I am always gonna have the case for manufacturing input as early as possible, because how you set the site up. Right volumes.

DOUGLAS RAMALDES - Software Engineering Role (Back end)

Nubank — integrations with AI, OpenAI, Claude, you can make a transfer, you can pay a bill using your WhatsApp, we have internal chat in the app where you can chat with AI and send voice, message.
Two weeks ago I LangSmith, tool developed by langchain, what is the price of LLMs and how many tokens I am using. Check hallucinations, develop some prompts
OpenAI SDK, openrouter (.ai),
Olivia AI — fintech I created connections with other banks, implement open bank. Open integrations with other banks. For example Olivia, you can log in and there is the two banks you can see all your movements and transactions aggregated. We implement scraping and reverse engineering, so we have to reverse engineering to access this bank. But now in Brazil is very common, all fintechs have access to open banking. Node, MOngoDB, Swift, Python.

Passeo Directo — estudenta — the most famous app downloaded in Brazil for students, I worked on mobile, iOS, Andrid, full stack too.
Social media for students, study network, meta for students, share materials of colleges, documents, share videos, my big delivery in this company, I changed the method of payment. I made this integrations, implement it in the company. I implemented payments, Stripelike Adyen payment.

Extreme — full stack for government, very similar to, all the project is for the government, I built using WhatsApp. Tool for conversational chatbot, after this I migrated to another company, after I migrated
Most complex APIs in TypeScript Node
Amazing solution for startups, actions using LLMs
Salary: 5k dollars now —

HENRIQUE PINHEIRO

I live in Indianapolis — because of Purdue university
We started just with a platform for food operations of a farm, because they have a lot of machines involved like tractors and so on.
What is the best combination? Maximize the efficient of the whole process
Five years ago we started to work on the robotics, AI to recognize weeds, why are things happening.
Most difficult and most need technology, challenge to get it to work in production environment.
I started to develop hardware — cameras, tablets, onboarding computer, weather stations, mosture sensors, soil sensors,
Robotics — when I arrived in the. USA I realized that farmers are very different for how they work in Brazil. We were just playing and we saw the opportunity. We first doing scouting and getting healthy info from the plants, we moved to recognize and spread weeds, our robot is full solar. Mostly cleaned and sustainable possible.
We do regonitin and spread the weeds. We just take the weeds, of the plants that make interference with the plants. Thermal cameras, some other sensors through cameras that work with some analysis.
Missing water, or missing something, weather, pass information.
It is o production, we have 200 units in the field. 70 in USA, 80 in Brazil, the rest in Canada and Colombia. I am working on other version. One scouting version.
Manufacturing — how the company works, I am the one who does the development with the team. I always do the first production, after that I deliver the whole process to other team that handles it. I am able to g back to the development. I always do the first production.
In the robot there is a lot of different areas, I can code but I am not the best coder in the world. I know C++, C, Python. I can do it myself but can take longer, I understand a lot of hardware, electronics, I can do it myself but will take longer than other people, data and stuff like that. The part that I am more weak is on the technical side, but I know. I know hydraulics. I can build a whole prototype just by myself. I am the middle of everyone to make everyone works. I do by myself.
Green card — citizen —

Mo Taher — SUPPLY CHAIN MANUFACTURING
LILIUM — vertical landing aircraft startup — I was in charge of developing manufacturing and supply chain. Dealing with supply issues. I started developing supply chain, 143 people
Head of cells supply chain — if you think about cells. 2500 cells in one aircraft. I was the head of manufacturing and engineer to make that aircraft. We invested in 4 startups in Europe which were supplying this, qualification. IT was very hard. Each supply 700 per week of these sales.
I owned everything. We were there because they didn't have the experience of the things you need to do on the shop floor. I helped them scale.
There is a lot to do. You need equipment, machines, investment of the Capex, you need to find the right people, people like production leaders and so on, and then you need to have a production floor, improve learn, because you will make mistakes. From prototype manufacturing to production maufacturing.
The most critical component is the sales. What is unique about this jet is the cell because this was what powered the engine. The cells are the unique.
You have the battery pack with the cooling system and power distribution. But the cells power the whole aircraft. That is why they asked me to do this role. The cell is very complicated and unique. It is a critical component.

Rolls Royce — Engineering quality, // ERP PROCESS — I was working
Procurement — I was working for finance, from transactional to class leading, we looked at processes, people. Professional accreditation. Work class organization. Head of procurement for IT. I moved into Procurement operations.
LIlium supply chain award. I am a serial winner. I am very good with people.
They make engines for aircradfs. I was in charge from a piece of paper all the way to when we sent it to Qatar. Getting procurement involved. Domestic sites. Driving everything so we get. This was doing it from scratch. 8350 Airbus — we produced engines. All the way to making a lease to a hundred engines. After that it goes into production. When it is productionized, it is serial production.
Head of supply chain — Factory transformation — brand new one. I was in charge of it. I was managing cost production.
Head of supply chain for Installation and Control — Owning Manufacturing and Supply chain. After market, all the product life cycle. All products. Covering 3 billion dollars spent.

_____

Week July
—
Arthur Nunes Correa — (HE DECLINED THE OFFER)
2020 — I stated working with Python
2021 — My first scraper — scraper to create flash cards to learn arabic.fi — my first one
Then mostly scrapers for fashion products.
2023 — 100 scrapers. The company has very large scale product in general. H&M, Adidas, Nike, Louis Button,
Spiders crawlers, proxies, reverse engineering, analyzing whatever the website is doing, testing internal solutions.
DIO Campus — more related to develop myself, job market, how to big candidate,
Ecole 42 — I really like it — I had to quit after a year, when I started working it was hard for me to go. Very asynchronous, the campus is 24-7, in between all the students we have test that we do to each other. We do that for many projects. I was going to do it in 9 months. I was like 7 months.
Algorithms — I am decent,

_____
DIOGO CASTRO — Web Scraper
TEchstack: Python, Scrapy, Playwright, Selenium, Django, JavaScript, VanillaJS, Postgres, MySQL, MongoDB, AWS.
 React, Viewjs, Angular,
I don't like Selenium much because we end up loosing a lot of time with It because it is very heavy in general, so I prefer playwright when needed to handle browser stuff. I run javascript scripts to handle log in and dynamic stuff on the web browser.
Zyte — Scrapy —
Here at Zyte — Shopee, it is a pain to develop scrapers for Shopee. Just to have context at Zyte we have the data operations team, which is the team working on maintaining the crawlers, and I am on the set up team, I am the one creating solutions for them. Adapt to the customers, understand what they want us to scrape and to deliver. While at Zyte, I had a lot of experiences. I mostly developed crawlers for e-commerce, a lot of google search on scraping. Getting crawlers in general to get information. We have custom options for the specific projects. I have seen a lot of issues.
I had calls with three customers last week. I am trying to look for a more stable type of work.
Information
We always like to provide the best solution that the customer wants, so they can work with us much longer. I used mostly scrapy.
Americana — Mercado Libre and Amazon — on Americana, basically we had developed different crawlers to do competitive intelligence, to adapt the price based on what we were scraping, we always had the cheapest price on the market. I worked basically with Amazon, Mercado Libre and Aliexpress.

Freelancing — I was mostly working with product scraping from different websites in Brazil.
E-commerce websites, I built spiders for Americana, Casas Bahia. Mercado Libre
A quick overview — I am a pretty experience developer, I have almost 10 years. I am very experienced with Java and Python,.
NEXT: I am looking for more stable jobs. In Zyte the stability has been downgrading a little bit. The amount of time of contractors are decreasing. They are trying to do more freelancers. I work 40 hours now.
Salary: $3.2k -> $3.8k

EDWIN PAEZ Backend
TEchstack: Postgres, Redix, DinamoDB, MongoDb.
A couple of years back came back to an IC role — that is one of the reason I came back to Rappi.
Software developer role. Building microservices, architecture, leading projects from a technical perspective. Highlights: I've been migrating repositories to GitHub, huge Python application. A ton of work modernizing. Changes. They will remain reliable. Bring in a ton of architectural changes. Sync communication to an asynchronous communication
Rappi launched Turbo, it will get inn 10 minutes. I was part of the team who did the technical design. It was more of an operational challenge, those references are gonna be new references. New locations, new people, culture and communication problem. The Turbo infra was already there. The challenge was integrating all of that in the operations.
Techstack: Python, Node and Go.
RAPPI — Engineering Manager for Productivity team — make shoppers curriers, make the most money possible. I had about 7 teams. Some were doing ETS prediction, how long is gonna take for the currier to take the order, for the restaurant to make it.
Also part of the dispatch team, select best currier to deliver order.
I was the leader of the manager of those teams. I was leading around 30 technical people.
Techstack: Python, Go, Nodejs.
LULO — first digital bank in Colombia. I was technical hire #3. I had to build the team, the processes. Compliance, legal. I was doing the whole tech. Took ownership of all the development. Digital bank in Colombia. Before you get the license, you have session with the regulator. For the past 4 years I came back.
Java and Kotlin. On the backend and native apps like iOS and Kotlin.
Grability — Simon selected a group to become part of Grability. Our job was to build native applications where users could build their shopping experience in their cellphones.
We had EL Corte Ingles in Spain. From zero to one, building this application. Simon had another idea. 2-3 years. He wanted to make Grability into Rappi.
I was part of the founding team at Rappi — 6 of us, 3 backend. 2 adroind and 2 iOS.
Back then I was also doing frontend. I did a ton of backend and some frontend for the admin. I was part of the Rappi team for around 2 years. Grability. El Corte Ingles.
PHP, Laravel, Nodejs, React Native and React
When NodeJS: it was 2013 when we stated using NodeJS. First version of Rappi.
Imaginamos —
C++ back in 2010 for windows desktop applications. I started building backends. I was a backend developer, Software developer services.
Next: looking for something remote. Founding engineer. Great when there are 10-20 people. Everything is still getting built and you get a lot of influence. I am mostly inserted in that. Startups that are
AI: we managed several machine learning models, in the last couple of years everyone is testing. I am building a voice agent for healthcare as a sore of freelance job. Mostly using the OpenAI APIs, retail ai, wrapping the LLM and connecting it.
LLMs for coding — mostly Claude Code and Copilot, GPT too.
Not played a ton with of Lovable.

Salary: $120k

_____

July 9th

_____

Raphael de Souza — Frontend Engineer ADDI
Navgar — offer from them. Pretty early stage startup. We are developing a lot of stuff. Roadmap ahead. Developing a SaaS for controlling workflows for companies. Imagine that you have a workflow for payments for contractors, payroll process. You will be able to do your flow and execute your flow and the app will organize the flow, send emails, set tasks to people, send notification, task, projects, entities.
ADDI — Fintech BNPL — frontend team, using React, very interesting architecture in Kafka. The user could get into the application start the payments and everything happens assycronosily. Event driven architecture. Great documentation. Product: basically doing shape up, doing features of the application, I was responsible for the payments module for paying your loan. You need to have a connection with other payment providers.
React + Redix +
Avenue Code — I was more of a Full-stack, I had to do a lot of Java, white label solutions for controlling HR schedules and Finance stuff. Payroll module. It was more like a CRM, payroll, contracts module. Like SAP white label.
React and Java.
Zup Innovation — it was the first job where I was doing Front-end. I transitioned to the front doing React and React Native. A couple of projects.
Telco — developed a web application, using React Native. We developed it from scratch. We were responsible for the app the consumer was facing when trying to understand accounts and megabytes left, consumer app, dashboards, support for the customer chatbot. The first phase was a chatbot but you had the chance to talk to somebody else. Chatbot where you could see options and get the answers.
Open source project — Itau bought Zup Innovation and we started working on Open Source projects. We started to do a lot of expanding on tech side. Providing to developers a framework for server driven UI. It means that you can define your UI in the server, in the backend and build your UI dynamically. For example if you have a mobile app, the user needs to update but now you can do updates in the backend. I developed two libraries responsible for the behavior of the frontend, on typescript, responsible of the whole logic and the I went big on React and built a library for React applications for React developers.
Before I was working as a full stack with NodeJS and Java. Kotlin and PHP.
Salary: $102k
$100-120k

_____

DANIEL UTGES — SOFTWARE HARDWARE ENGINEER

Head of Product — What problem is gonna make the company better. Head of product. How to solve, how do we launch it and what price. Once you launch which metrics do you have.
Product — user experience digitally, from your phone, understand before what is doing your charger. Automatic charging, excess, charge battery, discharge battery. Very technical. Bi-directional charger, charge it and discharge.
I was on the code side —
Dexma — Software Energy Management — it was you have a company tha consumes more than 1 million euros, we bough hardware, install them, get energy consumption, all the platform analyzed information and gave you tips of how to save energy. 10%-20%. Depends on how bad the client was.

People don't really look at industrial processes. Start things and not tuning off. Algorithms of AI. The AI more mathematical.
I have my family — we have talked about moving. One couldn't be for the Visa. I tried to get into Tesla Electric. If you get me something in SF with interesting conditions.
Other Roles — Customer service director / Product Owner / Living Role rather than an IC role.
Relacation —

AUGUSTO TERRA —
Techstack: full stack with a frontend speciality.
iFood: I work on the platform where the restaurants can access there. It is also a web application and I work mainly on two features, the orders that they have there, they can check how much they earn it for this project, and I also work on the financial features of their web application. Imagine If the restaurant needs to see where he will see the money from the sale. Other transfer, how much he will pay for fees. When I first entered iFood I was only frontend developer.
We have different kind of architecture, so we have a microfrontend. I work on this microfrontend project which is the one written on React. I work on these two different microfrontends. Both of them in React. One is responsible for providing and showing the user information about the orders that they have and the other one is responsible to showing the user the financial information. For restaurant owners.
Backend stuff — it is a micro service written in Kotlin with Springwood. Postgres, DinamoDB and regarding Claude we are using AWS. All of our microservices we are using also Kubernetes. NodeJS -- at ifood , we have these microfrontends, only communicates with one server bff this bff is written in NodeJS with Express, call all internal microservices that we have at the company. (Bff — backend for frontend)
React, Redux,
After AUQIO I entered iFood as a Frontend Development role.
Audo (part-time)— part time job. Two years doing a part time job when I was working at iFood. At Audo I was doing backend development. EdTech company with a web app where the users can find jobs, we have features, we have a job search feature, resume building, I work mainly as a backend NodeJS, TypeScript, MongoDB, Express, GCP. Product — I was building as one of the first engineer, I worked on the backend part of all services like the interview prep, integrating, speech to tech features to compare the user record there, the mock interview was good or not, we integrated with OpenAI APIs to see how they do the interviews, resume builder feature, we have a GenAI to create a resume builder.
AUQIO — At Acqio I was working as a frontend engineer, built a project from scratch, a fintech where the merchant could see their sales. The company makes the payments itself, but I was responsible to do the website.
Web application — dashboard where the merchants can see all the sales, all the features. TypeScript. Conext API. All the environment tools.
NUTCACHE — frontend development, javascript, html, css. Started learning in React. Work management tool software. I just stayed there for a few months, maybe 3 or 4. I worked there as a front end developer. The project was to convert a legacy to .net, a new version in React. It was pretty much my work.
Salary: $4k/ month

ALEJANDRO ZULUAGA BARON — Full Stack Engineer —
Workrise —
Howdy — I am working with a partner called Worries — Oil industry — I work on the finance module. I built 15 apps for the finance team. Apps that are very small. Team manager app, sell service and get the new hire accounts set up. The finance team is like 50 people. I wanted to build an ecosystem for the finance team. Apps: client onboarding app, they are using salesforce, invoice team and payroll, all

that stuff need to integrate, so I started integrating salesforce with Retool. Getting all the data from sales and getting all standardized so the finance team can invoice everybody. I built a task app. Everything using Retool. Components by Retool.
TechStack: React, Retool. Local platforms and components. Performance.
NodeJS? I used it every time. Retool doesn't require Node but I use it to build stronger apps.
IPG Mediabrands — Started building other products, media company. We tarted tracking all the metrics for clients based on the media things they did. If BMW posted on the radio, getting all the data from that. I built a full stack media metrics and operational app.
Techstack: C#, Angular, MySQL
Accenture — I started working with a bank, modifying the frontend, BBVA. Modifying the frontend of the mobile and web app. They already have their own framework. React and Angular.
Techstack:
Frubana — Prototype analyst — I was on the product team. Retool to build UI and products. I did a lot of projects in Frubana. Warehouse apps, tracking inventory. I also built logistics app. Frubana has a system where each morning get the products ready, and there are trucks where you can deliver to the whole city, I was setting the logistics. Frubana don't own trucks, they hire trucks, contract type. So sometimes due to the time, they didn't use all the trucks or they needed all trucks. They wanted to satisfy operations. The app, you upload the number of trucks that needs, the logistic manager, this used to llive in a google spreadsheet, they try to schedule the trucks. We didn't have a data base so we used a lot. It has three modules, one for all the trucks we have and are sign up, second is table to say how many trucks we need, and three is metrics of how many trucks and money we are spending. This app work for Mexico, Colombia and Brazil.
Techstack: Retool, Python, ETL, I tried to build in the product area. We had to develop things on a couple of weeks. GitHub. At the end we had Postgres, and JavaScript. Retool.
Data Analyst -
I am a mechanical engineer — I failed in love with the technology area. I started moving to the IT area. I started in a call center managing data. I used to work with my mom who is an entrepreneur, working with Shopify. I falled in love with that.
Salary: $5.5k

_____

FELIPE FADUL - VTEX — FULL STACK ENGINEER

I am a full stack software engineer 6+ years.
VTEX — context, I develop new features and develop marketplace integrations iwht companies like Amazon, Facebook, Mercado Libre. I created an integrations so seller can match their products at VTEX, because they have a catalogue, they can synchronizer their products between VTEX and Amazon. I built one of these integrations for Mercado Libre.
By matching the products between VTEX and Mercado Libre, they can sell more because they will appear first. Matching is building a screen so they can see their products in VTEX and Mercado LIbre, and they can say, this product in Mercado Libre is the same as their product in VTEX. If you have a cellphone, they need to search which cellphone is in Mercado Libre, to build this match, if they link it they will rank higher in the first page of Mercado Libre and will rank higher. To deliver this project, I first neeeded to understand their Mercado Libre API, collaborate with the designer for the best product and user experience. Maintain their partners in their marketplace.
I used React TypeScript and GraphQL< backend with C#, .net, AWS. But I mostly worked on Frontend.
I added a matrix that tracked over 3000 product publications per month. Because we needed to track how much our clients were using our app. So we needed to know if the app was being used to prioritize new features for this app.
I also built a TikTok integration app, it was a similar app in the sense of VTEX customers now can sell their products on TIkTok, it is a new channel for the merchants to sell their products. In React, Typescript, GrapghQL. I did all the onboarding of the app, get the info, synchronize info of VTEX into

TikTok store, so I built a survey to add info to connect with TikTok via Vtex platform. I created my own form, and then we sent it to TikTok, and they would create a TIkTOk store but everything was on VTEX admin, so we integrated with TikTok SDK. We also sent metrics to TikTok. If our clients clicked on cart, we would send the data to TikTok so they can track that and show Ads for the Shopper. Everything was managed inside the VTEX Admin. So this Admin is like a marketplace. In every single panel they can manage Mercado Libre, Facebook, Google, TikTok, they can manage everything on a single page.
VTEX is a single control pannel for all the orders, catalogue, logistics module, etc.
My team works with marketplace integrations — I build full stack apps. I currently work mostly frontend but I maintain backend application because I am the only person in my team who knows backend, so I work as a full stack.
EQUIPE SIGA — I had contact with infra, support, web development and mobile development. I built a mobile application with Flutter. This mobile app was created as a mobile app so university students the system takes care of the university stuffs. The student need to enroll in classes, so they can use it. This mobile app that I built helped student manage their classes and courses, issue documents from universities, issue a digital card ID to access the university restaurant, view classrooms, change their social name in the system, built in Flutter and have over 50k downloads.
Salary: $5k-$6k

JUAN PABLO GIRALDO — FULL STACK (likes both and good at both)
PayPal — I started working on PayPal crypto application, we started to provide the options to buy, sell, receive crypto. The second stage to send and receive crypto.
Then I started working on the PYUSD project. If you want to convert bitcoin to ethereum, you have to pass it through PYUSD coin. You can get dollars and you can sell it to pesos for example, I worked on the checkout for it. PayPal has the buy button and this button has a checkout and you have options like credit card, PayPal funds, and you can also buy with crypto.
Then I worked on another project, the UK Promotion, we expanded the PYUSD product to the United Kingdom. I have to work with laws that protects them from scamming, Crypto is a high risk product and we have to do very important compliance that everybody agrees to take this product. There are some flows that are not belonging to the US, so I had to create new forms only to the UK. The UK has a form that question how much you make per year to know your profile risk and based on that you can buy specific amount of that.
I was working as a full stack — React, NextJS (React), NestJS (Nodejs/Express), Nuxt (VueJS)
6Connex — I worked for around two years. First year working with Java Springwood, to TypeScript and View JS. Company for digital and virtual events.
second year working as a tech leader for mobile applications. It is an event company, you can do virtual events there. What they wanted to make was making more hybrid. If you are in a real event they want to provide support for the event. Functionalities like a map to reasrch stand, checking the line up of speakers, scheduling meetings within the event, check info. I helped build this from scratch. This one is for hybrid events
Bancolombia — I worked on the Tu360 Leasing Mobility Platform — I worked on different services on Java Springwood, NodeJS, Python, worked with MySQL, worked with different components in the frontend, with Angular. Create a platform where you can rent lease, and repair a car using financial solutions with Bancolombia, which supports this kind of use cases to perform enrollment.
Lab Satoshi — I worked on three projects, crypto platform, using solidity for smart contracts. Springwood the framework for Java for the backend. TypeScript for the Frontend. I started the second project that was a wallet which we migrated to angular and flutter. NodeJS, nest js, Typescript. Third project was an asset tracker, you can check the graphs, the time value of the assets, whatever. Backend using Python, Celery, Pandas, Pytoch and tensorflow. Provide back tesiting files that can be used with ai that wants to make a trade or not using decision threes.
Ambientes Inteligentes — the app for managing domestics systems, system design, I stated to make application with C++ with this frontend, for example if you want to split the gates in an AirPods, you

have more gates on the international. Automatically closing and opening gates, with airports, shopping centers, airports, homes. With domestics you have a restroom and you want to turn off the lights automatically or you want to see a movie so it turns on the tv or closes the window. Intelligent Homes Domotics.
NodeJS
Salary: $9k-10k
$8k to start intros.

———

JULY 10th:

LUCAS FRANCO — ZYTE WEB SCRAPING
ZYTE — main provider of scraping tools and web scraping software. I am one of the developers in their super team, I am one of those who fix scrapers when they brake. Second I am responsible to handle processes for clients. A process becomes a routine, and becomes a data operations team. I negotiate with the set ups team I move to the routine team.
If the crawler brakes I have to understand, debug, I have to analyze and do code reviews for other developers. My projects are more internal. We have different tools, my crawlers are doing integration for our internal tools. It is the same but not accesing outside website but internal data. Our platforms to monitor our customers, I have some develop some crawlers for our scraping platform. Scraping Cloud Platform.
I automate the hand over process, between the original team and the ones that inherit it when it becomes a routine. The handover process is a quality check, I need the project to become a routine, if the process has some problems and errors I need to check it. Check patterns. Checks configuration. One of the steps is the QA, I do some documentation. Have you done web scrapers from scratch — part of the hiring process, I did the internal process I access internal systems. The steps are the same.
How many scrapers — test and fix, more than 100. Creating from scratch 10-15.
Personal project of stocks investment platform.
TOTVS — the biggest latam company in software development, ERP, their biggest competitor is SAP. I worked as a data analyst and Senior Data Engineer. Responsible for Data Projects. I was responsible for the reports. Those reports were delivered for the C Level. I was responsible for the quality metrics for two big areas, software development and the support team.
Python, to process the data into the pipeline. It has many private tools, AI environment, and similar to PowerBI. It was very technical, when I started as a data analyst I was the main developer in this position. Then I became the data coordinator because my role in the company. When thinks I go hands on.
Technical in my academic formation — USP Master— Information Systems, it has kind of business disciplines. I know the technical part and the business part. Algorithms. Strong. Coding assessment, they are not close to the professional routine but I've done.
Salary: $4k -and I want 30%+
I would need to leave — just part time 4 hours woudlent leave company.

———————

FRANCISCO JOSE ALVARADO DURAN — FULL STACK — venezuela
Galgo — Galgo.com is a finance tech company, and I deal with different products. I built inventory system, I built a few apps for operations, right now I am building an AI Agent to automate documents verifications - here we are using LangChain, migrating to Azure, using the OpeanAI APIs. Langchain is that one year ago it was a better tool to make AI agents and make workflows using the tools and

APIs. Now we are using Azure because Galgo signed a contract with Azute to build on this platform. I am a 30% frontend and 70% backend. I prefer backend.
I started building Ruby on Rails, and two years ago we are using NodeJS, because Galgo grew and expanded to Colombia and Mexico and they think is a good tool to build new systems.
We started building the credit simulator with NodeJS/ NestJS. Migrated from one language to another. We migrated. Now we are building AI agents in NodeJS.
Inventory and Operations Platform — Inventory was built on a monolith architecture app in Ruby on Rails, we are using, we built a credit simulator, that allows to calculate all of credits based on the months taxes background. I
Merak — I built a few applications in different sectors like healthcare, building real time chats, using … I built a few web apps.
Techstack: NodeJS, React, Ruby on Rails.
Banda Ancha Telecom — I built automations for telecom, for telecom companies, equipment. I help configure the network.
TEchstack: Python and Django.
English: 6/10 — not too good to present
Salary: $3.5k -> $5k
this role is ok, but not too senior

_____

PRINCE BANGA — Marketing Manager BRAGI
BRAGI — Bragi is not exactly a consumer electronic. They invented the world first wireless headphone.
They work with manufacturing headphones and give the software, work with BOch.
B2B marketing — I run campaigns for them over Linkedin and over meta, do fairs, asian expos. We are shifting to B2C again now. You can upgrade your software and have an app to upgrade your software in tyour head phone.
For us is very important to have B2B sector, I got the company with Microsoft. Spent less than 150k euroes. Qualified leads and meetings. Run the biggest re-lunch of your website when Bragi AI came out. How to manage their brand when they are ai company.
Our sales, works with CTOs and Technology people of the company.
2 million units crusher NC Two
Skullcandy Crusher ANC 2 — 2 million
Bose Quiet Comfort Ultra —
We can of give them the material, own products, I do mostly B2B marketing. Working with Bragi is the software. It is a B2B.
I used to work a Goole App optimization specialist — keynindicator brand awareness, display Ads, Google Ads, the last 4 years I ve doing LinkedIn marketing and B2B marketing. AI project for a year and a half. Help their AI brands do their AI Portfolio, how to increase the sales, what kind of language to use. Track the line where it is consuming friendly.
Biggest thing is cross function managing, sales, design, product management, cohesive, what we call the product how we present it to managers with presentations, designers doing consumer design.

– He is not necessarily the right person for OMI but we learned that Bragi has amazing software developers for founding engineers so lets add them.

_____

CRISTIAN GOMEZ — FULL STACK + ANDROID
Techstack:
SECTION — Flutter — a company that transforms companies with AI, help companies learn what AI can help them to do. We want to help employees learn what they can do with AI. We create courses.
Web app — I entered to build the flutter app, but it is gone, because we don't have as many engineers to support a mobile app right now, it wasn't used so we stopped giving support to the app. It was a

frontend full stack. Now Nest with Typescript and React with TypeScript. I have been using small projects for freelancers, pretty much a year and a half
AI integrations — not yet, there are multiple stuff, if you look for Section there is a new product we are building that is called Pro AI, tool to create dedicated courses for a giving plan, right now we are having something like a basic prompting course, learn how to write better courses with AI. React and Node JS. Some calls to create how the questions get in the
Prompt AI — I am support engineer and I work for this company and creates a custom course for you to learn how to create better prompts. Framework for creating prompts. That is the idea of how to teach and how to prompt. Let's think about this exercise. You're a software engineer trying to do something that is reporting to you. Several users to log in into the platform. AI analyze the prompt and gives you a course to how to get better on that.
That is the next feature is having the ability to create new content. The platform right now only supports new courses. Adding more courses shouldn't be that difficult.
Antropic APIs.
Langchain not yet, I don't know how to use it, something I need to research.
HOPPER — Android en Hopper — it was kind of s similar role, in that moment Hopper had an integral framework for UI from the backend. For a lot of developers who were creating APIs you need to learn Scala to deploy ui in the mobile app. Android native. Other screens using our proprietary framework. A lot of interedsint bugs with payments.
Indigo — was my first attempt to be a full stack - opportunity for me to do full stack with Ruby on Rails, and also React with TypeScript. Payment reconciliation product. Internal calculator for knowing what to pay and when to pay for different contracts, calculator helped knowing when we receive the invoices and when to pay them.
Pager — healthcare SDK — Sura app — I was leading the SDK on Android
Salary: $12k
$120-140 doesn't work — he is too expensive and not that articulated.

___
JULY 11

_____
HEMANT PANWAR

NOISE — I have set manufacturing with noise of wearables. Coming from product development, from scratch to mass production. The first smartwatch, the airplanes.
I spent 10-15 days in China for development piece. We import the materials. Give it to a factory in India, setting the assembly together. We have a joint venture. 50% owner of the factory.
This is a full development thing, contract, get the product ready, then we do tests, the production team is involved in , special equipment, features, assemble in the manufacturing. Machines that can test all the features, all machine needs to be installed. Team in Chl
Factory — set up the factory — bought the land, bought all the equipment, get workers, on job training,… decent amount of
The products get developed in China. We have a team that develops
IN india design the product, software development, then it go too operations stage. Get the electronics,
I have a team of 20 people who report to me in China. We already have. We already source there. We are designing. IN India UX,
BEFORE — electronic graduate engineer, I used ro work in mobile development companies.
Zion — product, mobile phones. I was living in China — I set up the whole supply chain. I built the office, hired the people. They already had a factory. I was more in product and supply chain. I contributed how hardware design look like, technical features, how software works. How you see and how you experience and how you use.

Intex — taking care of the technical product, materials, when the product in launched. Mobile phone, power banks.
Micromax — I learned quality, manufacturing quality, quality standard.
Salary:
Relocation — Open to talk about it. I ve been always a traveler. I
LA — dates:

_____

DAVID PERALTA MIRANDA — SOFTWARE DEVELOPER NUBANK
Pachuga Hidalgo —
Nubank — Currently we have 100 million users worldwide — I am building the User interface fort the new countries application — I make the new templates for new apps., in the new coutnry. I make the templates and other teams are gonna adapt the templates to new countries.
We try to make the templates as easier as we can. Set up in a way that can be easily adapted.
We create the user interface template so they extend the class of the screen and they add all validation and configure and set up. They can configure the id validation, location, regulation,
Techstack: Clojure, bdc framework, it provides all the libraries, the components for the app are made in flutter. Frontend mobile framework.
Here no react or node, the bdc framework makes the code being in frontend components.
Mexico Inmobiliaria — Digital Real Estate company in Mexico, listing — they train the real estate brokers to sell to buyers. The idea was training the brokers to attract more brokers to the company. The platform has the advertising, and educational portal. That is basically the income.
I was involved in everything. The company was s startup. 12 people on technology, 8 developers. 2 managers, 2 QA and business analyst for technology team. I was the backend lead.
Teachstack: Javascript, React, Python, Django rest, MySQL Postgres, Dinamo, Redis, AWS. S2 for Containers.
50% frontend and 50% backend.
For the lambdas in NodeJS, all the configuration libraries, was in Node.
HULU — User Interface Management — we created a backoffice tool, if they have an event like San Valendin day, they create a collection, special episodes, all that confuciration and setting can be used by the client.
Setting Module — different because this setting was only for content, organized by collection, nagigation, special season, when you open Netflix, in the right side of your devices you have movies, sports and general. All of that collection is settable, you could select all special seasons content in a single tab in your device.
How was it possible - you could select, by country, by creator, by genre, once you selected the content we delivered through an API. Icons on listing or Icons.Product was a Customization / Personalization Engine.
Was it successful? Yes, we had a great feedback from the users. Was ti working by Disney. Yes it was used by them.
Techstack: React, Python Django, Flask. Node. But here most of the infra
70% frontend and 30% backend
GLOBANT — eBAy and HULU — with eBay I worked on a platform, it is a marketplace, the people near you can interact with you. They closed the project after that because it doesn't work. They offer the same product, better and cheaper. eBay was trying to charge a fee for sign up. Marketplace. The product we were trying is we were trying to charge a fee just to sign up. The product was awesome, the location, the listings, I was working with the user interface with Angular, we delivered the product and it was working
AI SEA — JavaScript, jQuery, I liked it too much. We had a lot of naming for the . It can be the system for scores and tracking go grades.. I was working with admin of college.
IIMAS — I started with a webmaster position, I have experience working with servers and configuring them.
FEEDBACK FOR HIM

Recommend first principle thinking
Don't explain too much — no body cares if the product didn't work, you can comment it but it is not the most important. Focus on what you built and how. (eBay)
NEXT: If I only focus on Closure my only place would be in NUbank. I want to specialize more in NUbank and Python. I am looking for opportunities outside of Nubank. I am better as a frontend but I like the backend the Python, PHP and NodeJS, I have used Express and NestJS.
Salary: $4.5k / monthly + benefits like healthcare, bills, some other expenses, one month of yearly bonus.
$5k+ 6k+

_____

PEDRO NASCIMIENTO — NUBANK —
Techstack: React (not much recently), I am ok with TypeScript.NodeJS, Python not much,
NUBANK — I have been on the same team. Open Finance team — API Standard that allow banks to share customer information with others, it is very common to have a bank account in many banks, and anybody can offer you better products. The team at Nubank was just starting. I was the 4th to 5th. I focused more on the initiation. It allows you to initiate payments. Initiate a payments using balance in another bank account. From a single app manage the balance of all your banks.
Regulatory — provide resources for other banks to access. In the past we had up to two months ago, I was working on the product side of things. Single one click payments. Customer gave us permission to access other banks. I was building an open banking wallet where you could manage all your money everywhere and in every bank.
Provider side, things that we are mandated to do. Consumer side which is the inetersing part, bringing data from other places to NUbank. We launched in march, in 4 months we had more than 1 million people interacting with it and 200 million dollars in deposit. I started working on this on December or November.
Techstack: very niche, our language Clojure, it was a language, it wasn't created at Nubank, it a fictional language. Database: Datomic and DynamoDB. Kafka, AWS. The app code is mostly on Clojure. Gets complied to native flutter code that works in the app. I am working 70% backend 30% frontend.
BIT CAPITAL — I joined very early, it was a fintech, digital bank account, the Pix. The payment system. Before that there was a legacy system that took like two days to settle payments, we had two other payments in Brazil that was called Boleto, we integrated with account providers, tech providers and we were on the initial implementation of Pix, we were among the first institutions to implement Pix. I became one of the senior people in the company. It was a Software as a service where you could build a digital bank on top of it. We offered Banking APIs for companies that wanted to implement banking products.
React/ Typescript. Postgres. Redis. It was on top of Blockchain, Stellar blockchain. NodeJS.
Venture-backed — we had a seed, it never had a series A. It raised something on the order of 2 millions reais.
ESTUDIAT COM VOCE — EdTech — The company produces educational university videos. Providing the video, controlling access and subscription. I became the only developer when tech lead left. Ruby on Rails and AWS, Postgres, Redis. React/TypeScript.
Tech team was a small part of the company because there was a lot of content production — the thing that differentiated was the quality of the content from classes from some specie universities. It was similar to Coursera. Khan Academy was a better comparison. Developed everything from scratch? There was a well stablished code base. I joined when the company ws 2 years old, we had to develop some projects from end to end, and existing code base. We had a job board that we tried early on. It was focus on university students.
Airbus - not related to software
Aeronautical Engineer — Assembly integration facility in Germany.
NEXT: React +
Salary: $120k / year —I want $140k

JULY 14 Monday — WEB SCRAPER
JOSUE FERNADO CITALAN —
Data Builders —
Scraping data form HOmedepot,Costco, companies that sell Wines.
Data Scraping ROle in the first months and now I am working to build a SaaS platform to manage scraping and model data. I am doing full stack: Django,
Infrastructure — AWS, Kubernetes, Docker,
Electric Power Markets — RPA Developer — Energy trading startup, build forecast of energy in Guatemala. My position here was automating that data. The company managed a software from Brazil. I need to learn all documentation from this software and insert data through API. I need to start talking with that guy from Brazil.
RPA, I was automating a website in Guatemala, the private organization in Guatemala that publishes information about the energy, from all the companies that I need to buy energy from and sell to energy to, I need only 30 minutes to populate the energy in that website. I leave around 5-10 notes in parallel to get data form that website. When you finish the website, I get data from that page. I discovered that trick in the website, what we need to implement to populate data in 30 minutes. I just have a time window to scrap data from the website. Only 30 minutes. IN this company just one web scraper.
&Cafe SA — Coffee shop, it is like Starbucks from Guatemala — that company has grown a lot with the years, around 50 branches. Here I implemented Scrapers to maintain data from some banks. UIPath.
In the beginning was automation, then I was scraping another page, about the coffee, because that company didn't only produce coffee but also sales to other places. Scraping commodity prices, the kind of coffee that other companies were selling. It is a little like 5-6 websites. I need to use a Proxy because some companies block you. Libraries: Selenium, I implemented a built web pages with React and Flask.
My biggest role was managing databases like Postgres, MySQL, SQL server.
Salary: $3k minimum expectation — 3-5k

FELIX EHUAN — SOFTWARE ENGINEER
Techstack: NestJS (a bit of NodeJS), but mostly C#.
Ski dot Com — http://ski.com — It is a ski e-commerce company. Frontend maintainer. AWS. I am also a full stack. My current responsibility is having the frontend. Some backend: C#, .net, NextJS, a bit of NodeJS.
Framwork — https://www.indexic.net SaaS for managing stuff for small business, they can have leads, amangement, accounting, online bookings, and this is managed by them. I started as a frontend developer and then a full stack with C#, Azure Cloud,
Future Stay — UI developer, I was on the product team developer interfaces, mockups, animation, then I moved as a frontend developer. They have the UIs who deliver the mockup, then the frontend is glue that together. I was 3 months as a UI, then around a year as a frontend. I was working with the product team: Laravel and React.
Started working on software in 2017 with Angular, then with React, I have a lot of expired with them. Then I swtiched to NEXTJS.
Education — Physics Engineer —
Salary: $4k / month but now he is earning $35 per hour for projects.
For part time projects I would be flexible.

KEILLA MENEZES FERNANDES — Software Engineer Nubank — Full Stack
TechStack:
NUBANK —

Before Nubank
Full stack developer, refugee product, a car insurance. They have a big app, with other products apart from savings and credit cards. For example you can buy insurance and tickets inside the app. We had this idea of selling insurance from NUbank. I had to support. I joined Nubank as an IC, having ambiguous problems, support the other developers, architecture.
It was successful because Nubank has a lot of problems that they have inside libraries, we don't write any Flutter, you write backend code, libraries that we built together for Flutter. Just go to the backend, deploy and you have new improvements and features in the same moment, I built the product, having the backend. Inside insurance.. It was great because we achieved our OKRs.

Payment orchestration platform. I want t charge my customer charging from the credit card, these connections were becoming bigger, so the payments and transfer platform was born 3 years ago. After the onboarding, basically what it does is orchestrate money. The problems, we take care of authorizing, where is the money coming from, savings account, just integrations.
How can I build a platform, big improvement, to evolve, integrate new use cases, products that were launched before, currently I am supporting the lending platform, where a customer asks for a loan, the deposit goes to savings account. If you want to connect, an engineer needs to understand the integration, configuration, how the protocol works.
Techstack: Clojure (backend), Clojure frontend, JavaScript, React,
Docker or Kubernetes, I cannot configure this.
NodeJS, not much python doesn't have experience
DELL — Frontend, it was a global product, design system portal. For other products in Dell, I wasn't working on library but all the content that was managed, not only starting websites their idea is personalize the site about components. It was because my experience aa a product. A design system. I don't know if they became public. I was since the beginning.
Dell needed a design system and they built a portal, they long term perspective. The customer, I have it, this platform would be managed by content writers, how they work, as a user, as a customer of the website, interact with the app. I wanted to get insights of the componts, I understand that since the beginning is not only the frontend, I could manage the different components for building frontend. I could manage a lot of things in the backend. Go to a full stack position. Full stack is not doing just surface but going deeper, when Nubank appear as 100 million customers, scalable apis
THROUGHWORKS — Natura - working on frontend, mobile application for the user, one of the projects that I built for Natura, they were acquiring many companies and they wanted to have components, web components.
Daitan Group — here I started developing leadership skills. Before this I was kind of full stack more focused on frontend. Here was the first time that I started to specialize more of 70% of my time in frontend 30% backend. Scalable frontend apps
Natura
Code vs. leading:
Feedback — she goes too much to the details but doesn't really explain th problem and business goal initially and the go to the detail.
English: 6-7/10… she is very smart but it is difficult to understand her articulation.
Salary: Contractor $10k / month.
I have a good salary in Nubank and stock options.

_____
LAUTARO COLOMBINI — REACT NATIVE —
github.com/LauColombini
TechStack: React, Python, NodeJS, MongoDB, Postgress, GCP, AWS
full stack mostly focused on frontend
FRESH AND DASH — React Native expo, a lot of integrations.

Product — it is an app wellness app where you have courses on mental stuff, pilates, yoga, fitness. You customize the profile for the clients. We have the designer, Sigma, to React Native. Right now we are only two developers.
I support a little bit of backend but is not my main one.
TECHSED —
Techstack: React, React Native, Typescript, GCP, was, Nodejs, Nextjs, Nestjs, SQL, Postgres, MongoDB.
GitHub:
I have a project that I built two months ago. https://starmap-web.vercel.app — I made the integration with Mercado Pago. From this library — https://rhodesmill.org/skyfield/
https://www.thenightsky.com
PIVOT VENTURES — Polser.io — It is a CRM built for people who have a lot of clients through WhatsApp and Telegram, sense of when you are talking. Clone your voice, integrations, what app business api https://polser.io/
They already have the web app, I made a lot of progress. Parallel, I manage the pipeline with EAS Expo, a pipeline that you can deploy different versions of the app.
I made some microservices with Python and Lambdas in AWS.
WEELOK — startup — web3 social media, they wanted to onboard web2 people to web3. I built the app from scratch. I made the repo, integrations like Wallet connect. Participated in crypto events. 2.5k people using the app simultaniusly. We made the app, a wallet custodial project. React Native.
CHIPER — when I entered to the company they expanded to Mexico and Brazil, I was only React Native developer there, they promoted me as team leader in whole Brazil. Website app, React native app, for the warehouse and deliveries. I had 5 people on the team.
Salary: $25/ hour — $4k/ month.

GUGA GONGADZE — SOFTWARE ENGINEER — GEORGIA
TechStack: JavaScript Ecosystem, React, NodeJS, TypeScript
Rust, Python, AI Engineering,
Personal Project — Orchestrate and Consolidate Information AI Tool and Agentic, can act on info —if you are a big company documents and information are spreadout, how to interconnect everything connected with ai interface chat, MCP servers, clients that connect with these data bases. Azure stack.
Move Work Forward — ecosystem based on Atlassian — connect to Microsoft teams and Jira — When you have to go into it it is a very interesting challenge because you don't have control in Microsoft and Atlassian but you have something in the middle to connect them. NodeJS, TypeScript. It has like 10 products
SHUTTLE — Platform for Deploying Rust Applications — have a web engineer and you have a team, backend services in Rust, by using Rust as a language. Your target audience is an engineer itself and you have different products for them. I was doing React with TypeScript. Backend? I was doing backend on Rust.
UiFLOW — acquired by WorkDay — It is an internal tool at workday — website builder that can program logic itself. Visual program language, drag edges between the notes. My main resposability was using the language and creating different components like loop, or logic componets, ui components, whatever is needed to build a website. This was targeted for enterprise customers. This whole thing would generate javascript as an output, docker and deploy it anywhere. When you have this docker downloaded, automatically deploy in your Kubernetes services. React, Nodejs, docker, Kubernetes, AWS, Azure.
TopTal — Claap — A loom alternative — https://www.claap.io — frontend and backend engineering, help develop a chrome extension for them. It basically worked like Loom. To share the screen, annotate it, save the video and send it to your co-worker. I was a member of a team od 3-4 engineers, I built the main UI and video processing in the backend with NodeJS, AWS.

Hexagon — https://hexagon.com — measure sizes of tools — I was hired as a consultant to migrate Angular to React. Also training.
Kubernetes ?? Yes
Salary: $7-8k
3-4 hours overlap.

_____

LUIZ FERNANDO — FULL STACK REACT NODE

TechStack
I have 5 years of experience, b2b and b2c projects.
Lexter AI (YC — we build products for the legal market. Document pipeline for lawyers. AI to help legal teams and lawyers. 60% frontend / 40% backend
We are building a WhatsApp agent to connect people to our clients — we acquire leads from different markets, we have some Ads running, we tag and improve their quality and we sell them to our clients.
AI first company. All of our products are AI first. At the beginning, before LLMs were common, our generative models, we were building our own models. Before everyone becomes an AI first company.
Frontend: we have a platform on React, it is AI-powered CRM for lawyers. We increase their productivity.
Backend: NodeJS, Serverless technologies AWS, MongoDB, Postgres,
AI Code: I have sometimes, make prompt improvements, prompt engineering, nowadays I don't use a lot of tools. I also find models and improve outcomes. We have langchain infra but we have data engineers that work on it, I don't work on it.
They told him that in the first day I have to be 100% productive, I got to get more context before I joined the company, I tried to talk with colleagues before starting, trying to access people. Access questions, get ownership, understand what the client needs.
Hardest technical problem in this company —my first product was a document processing pipeline, after almost two years the company decided to pivot, I had to basically do a data pipeline, we didn't want to basically remove the project completely so we can keep the clients, I had to build a data pipeline, get data from different data bases, do what a data engineer does, I had to learn strategies to get data from data bases and make it available for users, do it in real time and keep it reliable. I had to build a reliable dashboard. I learned how to extract data, I had to learn about infra.
Working with different types of codebase — I like to work end to end, because I want to know what I am doing, I like to understand the first principles of everything, and understand the company strategies and make decisions based on that and a way to achieve that is knowing more of the company and knowing more of the code base, to being able to contribute more. The more technologies that you know the more power and responsibility you have.
Cadmus — I was in a project for General Motors, we had a document processing pipeline, I led the frontend team and also worked on the backend side. I implemented a lot of features to process document. Extract info from documents. Only JavaScript, React, NodeJS, TypeScript, Azure.
TOVS —frontend — They basically make software B2B — they sell software to companies, markets, systems, pharmacies. ERP, RH. I worked on their new CRM. This was a big company. I learned about the processes in bigger companies, how to deal with people I could be organized, understand where we need process.
Arvore — B2C product for children that want to read books, a mobile and web app to read books. Sold the product to schools and parents. It was my internship. It was my first experience, understand the whole system. We were using React and React Native.
Why would you leave Lexter to another company? I love Lexter, but what only makes me look for something else, is the possibility to work for something international, something that will target more people and a multicultural team. I want to join a product that can become massive, that many people can use, where we can have a bigger scope and more clients, more infrastructure problems, work with complex problems. Most of the challenges come with volume and when you scale something.
Salary: $3500 now -> wants: $7k

JULY 16th
LUCAS DAIKI — SOFTWARE ENGINEER — TYPESCRIPT
TechStack:
REMESSA ONLINE —
I have been working here almost 8 years. I can tell a lot of big projects. From USA, Europe, from Brazil. USA to Brazil.
I worked since the beginning when we were like 30 people and now we are over 300 people. It is not huge but we have big projects and products.
Banking migration — I developed from the begging, I defined the solutions, the rules. After that I worked leading my team, less than 3 months we migrated from a financial institution to another one. We released an interesting product and scaled our operations. Scaled the ops 10-20x. It is the most importat because it was the biggest milestone, because we were a startup and we became a real company with this. Before that we were a commercial representative, with this project. Building their own infrastructure to transfer money. Before we had a manual communication with financial institutions, with this we connected with them using Rest APIs.
We created a project to do money conciliation, to find errors in the operating system, to make it most of the time, a 100% automatically.
In international money transfers we have a lot of small problems.
I am working as a backend with NodeJS, Javascript, TypeScript, Docker, Kubernetes. ECS I am migrating from ECS from Amazon, to Kubernetes.
I migrated to software engineering to tech lead, I migrated from a platform team, I am now tech lead of two frontend web and mobile boys. These days I am working more with React and Next.
Hardest Techical Problem — understand how the people works. Scalating the ticketing. We send the operations to the bank, we create the order, and the bank makes it. We have to understand well the operations life cycle and understand from beginning to end. Event driven architecture. It opened a new world for me. Handle exception cases. When we started we took an easy path, and then we needed to work with different operations. Money coming from Europe is different from money coming from USA, so we needed to design different backends and architecture for the different use cases.
Startups — yes, most of our clients were startups. I am a creative person, I like to imagine the things, brainstorm ideas, and startups have more space to contribute with ideas and different work. Big companies are like a black box but here I know where I am contributing to the product and the teams.

EASYVEST — it was my first experience as a frontend engineer, I only had one project, I had to migrate one old portal to a new structure. From C# to React, using NextJS. It was a broker of shares product for fixed income.

VIZIR — we were a software studio so every month changed my techs. Many kind of projects. Best school because I studied a lot of javascript, rails, c#, python.
Salary — $Reais 90000 reads every month — $3500
I intend to have $5k

NELSON GARZON — KRIPTOS
Barbosa Santander, carretera Moniquira, ese es el ultimo pueblo que tiene Boyaca y ahi comienza Santander.
TechStack: Python, Django, FastAPI, TypeScript, React, Golang, C#, Postgres, Dinamo, Redis, MySQL, OpenSearch, S3, Lambdas, AWS.
We use Python native. Because we deploy on Lambdas.

AI - OpenSearch — vector data base.
Software Developer. I have worked for 10-15 Yeats. My main language is currently Python, I have experience with AWS Cloud on technologies focused on scaling availability big data. I have used MCP to communicate chatgpt to query data bases like Postgres.
KRIPTOS — Now I am working on Classifier, the main product. It is a data classification product., for unstructured data. Classifying files in work stations. The system scans the document, transform the content of of the document in an enbedding, representing in numeric positions in a vector, meta data to send in the backend, and we classify it using AI models for classification. For example credit cards, personal data.
The product is focused on banks and big insurance, where the sensible data is in the company, every employee has a computer assigned to. Him. You don't know if the employee stored sensible data in the laptop, if you have credit card numbers in a document, this engine has th power to check it and classify it as classified information. — OLPs — systems to block information in the storage, for example in the hard disc if you have confidential info, it makes you to avoid to see it or share it with another device. That guarantees the security of your information. This is the first step to guarantee. The first step is clarify the info, tag info, and block it. They connect with an OLP after the clarify, so the OLP can block it.
I updated the code, divided into microservices, because it was built on an old version of Python. I also worked on C#, Golang. Not core languages but I know about them. TypeScript — I have worked with it doing a microservice doing the front end also, because it is used doing React. The micro service is able to query information from Postgres and Dinamo, from the web platform.
Hardest Technical Project - I think it would be to build the system ingestion. It is a system to ingest a lot of data, 18 million documents per day and ingest that data, in a flexible way. That is not only writing a lot of time in the day with high performance, search the data, query the data in different ways through OpenSearch, Python, Dinamo, and Golang.
Kubernetes - in the past I used them, maybe 3 or 4 years ago, deployments, we used it for the classifier, it was built on Kubernetes and had a lot of projects to scale up. Maintain the project on Kuberntes, so I had to do deployments.
Startup —In a startup you have a lot of challenges and you specialize in one product. You have the opportunity to go deep into a product and build it. You can also have a wide look about the technologies at the same time. Narrow on the product and broad on the technology.
APIUX — It was a consulting company, I worked with a team, working on a project about working on the functionalities and services of health companies. The company audits healthcare companies in Chile. We were building the software for certifying health services in general, if a hospital wants to open the services, lets say, brain exam, the hospital needs to build the process and describe the process, assign in different stages, be sure that the team is able to work with the process and stage of the process. The hospital needs to send a lot of information about the process, people participating in the process. Public Healthcare Compliance Platform.
Salary: $6k -> I am looking for $8k/ month

JEFERSON FORERO GALVIS — FULL STACK — TOP DEVELOPER TOP — Special FOUNDER. ********** (but bad English)
TechStack: TypeScript, React, Angular, Mobile Java, Kotlin, Python, SQL, MySQL, MariaDB, Firebase, MongoDB, Postgres, AWS.
Docker? Kubernetes? Todo lo manejamos dockerizado en AWS,
Me gusta crear producto a partir de ideas que me se me suelen ocurrir. Apórtate mucho mas de solo de desarrollo.
WIWO — I am building an app that connects employees with employees, you like and dislike, like Tinder, if there is a match, both need to like. There is a match, We have s system of interested people, a recommendation engine. We work with large companies like Starbucks, BurgerKing, using the app.

GRUPO ALUS — Full stack developer, we develop software for different companies, BBVA, Bimbo, Mercedes,Loreal Paris, we have a base in Angular with TypeScript and the product is a rewards Ali system, where we redeem rewards. Worked with Golang.
SORTEAME — it was project, it was a boom when influencers were building digital lotteries, I build a system to build lotteries. You buy the numbers and they arrive to your email. Web scraping depending on what lottery you select, to announce winners, having statistics.

RAPPI — I was part of the customer service team , when you had a problem, there was the Lupe platform for solving customer requests, with chats with customers, fraud detection, analyze the curriers, clients, more than anything optimizing and facilitating the customer agents that take many tickets at the same time, help with the resolution, no shortcuts, outside of work I build a whataspp business system with shortcuts, depending on the client, having different requests, you click some commands and optimize time.

TREINTA — I built Treinta Web, I told them to build a system for restaurants. It is a POS system for restaurants, managing tables, menus, inventory, and so on. Additional to everything the app does, I built the web platform. It was a POS system web to manage inventory, clients, vendors, balances, sales.
TAKI APP — it was a very well known platform, it was a competition, over 10,000 users. It was a mobile platform for different companies, mobile and web, super fast, native, in Java with Kotlin. They made me an offer, I sold Taski,
English: 5/10 — worked with Rappi in a service, I don't problem to follow this conversation, but need more explain for this question, my question…. I like the how the name of this… ehhhhhhhh…. I like the solving problems in specific service and clients, I like to resolving different problems, the job in this moment,
Location: Cali , Roldanillo
What motivates you to be an entrepreneur? I started building software initially for small businesses, I did inventory system and payroll because, for people around Cauca. I built a POS for somebody. A woman went bankrupt and couldn't pay, and I decided to improve it and make it for everyone. In 3-4 months in reached 10k business registered. At the start it was posting on Facebook groups. I invested 10 dollars in marketing. But in became words of mouth thing.
Salary: $5k -> start from $5k to talk

DEYBER CASTANEDA — great at AI Development
TechStack: Python, bacend development in general, Java, Nodejs, FastAPI, Django.
S4N — I am building AI applications, right now I am building LLM based applications, also apps that use ML models. Mostly Chatbots, Healthcare Coach that helps people have a track of their nutrition, give them some recomenddatin, voice processing, a chat, agentic platform.
LangChain — LangChain, LangGraph and LangSmith — FastAPi to build the APIS, Django — receive data from different institutions like Stanford medicine academy, data, we use several agents to do something. We have an agent to improve the way … recommend actions, based on the knowledge about you it says or recommends to take a walk, consume certain amount of proteins or carbs, we need an agent to be on top of your work schedule, when do you spend time with your family, multiagentic, every agent is capable of ding something different, multiagentic architecture.
Right now our client is https://www.thrive.health/ — https://thriveaihealth.com
Here we are building
MASIV — https://masiv.com/ — data related projects, creating an ETL for running some analytics processes, data warehousing, data streams, data wirehouse. — we receive millions of communications and we wanted to take advantage of the transactions that we have. We wanted to use that data to implement into the campaigns. With that skit we would analyze, offer dashboard to clients where we show the time we sent the message to the moment they opened the message, how

many time they spent on the page, analytics. Communication Operations and Analytics Platform, Data Communication Platform.
We had a data team, that was responsible for data ware house
GLOBANT — Pure backend development, our client was Disney, what we were building was a platform, we were implementing new features. They wanted to optimize how to schedule advertisement. They had a lot of products, for Disney Channels they wanted to optimize the way they will show an advertisement. They wanted to build an algorithm to optimize that. Advertisement Optimization Platform. Give some analytics, and algorithms in some ways, some parameters for every advertisement, how much money the user has for advertisement, how much money do they have, what is the best time to show that.
Feedback — please explain the product in 5 words first and then the details, you go first to the details and that makes people get lost.
TypeScript — yeah, it is not my main language, but I use it. APIs doing Express and Node, and apis for web development.
Kubernetes — ?? Mainly used Cloud providers to execute it. Definig services, pots, orchestrating network between those pots. Making sure the Kubernetes definition is well stablished. How to set the environments, how we integrate that with the infrastructure.
Startups — as I mentioned, I am mostly working for startups, and I am aware of the high intensity environment in startups.
SALARY — $5.5k >>> $6k
ENGLISH: great

_____
JULY THURSDAY 17
JOSE FRANCISCO LIMAICO — KUSHkI
TechStack: React, Node Python, Golang, Docker, AWS,
Native Python, Django,
Most of the time we use
Products in Kushki — Console for clients React and NdeJS, managing clients and clients can see the transactions. Transactions CRM Platform, also to customize commerce, integrate payment processors. Reports about the transactions. Payments Console.
Integrations with local banks and international banks. We created a system to integrate banks and sending payouts, created with Golang.
We created a system to process files with all the transactions. Transactions provided by the bank, process dos, integrate and make payments, provide the final status to clients.
Currently I am working for an onboarding process for new clients, onboarding process where you can create merchants, when you want to affiliate a new payment point, you have the infra and the view. Process for onboarding. You get of the process that shows all info that the clients needs to complete.
Documentation? Write — I provide the info for the projects, technical writers, they are the ones who provide the documentation for the products. I don't do it.
Salary — $2.7k>>>> 30% up.

_____
HUY — FULL STACK
Located: Orlando
CityBlock Healthcare — No traveling — prefer not traveling. Right at home.
TechStack: Frontend — I have been working with Angular and React.
CityBlockHealthcare — NodeJS TypeScript.
CityBLock — we have an internal system that allows for our clinicians to treat their patients.
We already had a product, some of the founders engineers, our job was to add more fictionality to it. I hav
Senior Level

Salary Expectation:

_____

MARCIO DIAS — NUBANK
TechStack: NodeJS,

NuBank — My main focus was to get all the Nubank client information, make an ETL, recommend Nubanks products, chat and insights, I saw that you had 3 signatures and the user can share, it is an LLM, how much you have inn your bank account, what is the best investment for me.
We built it with LangChain, and now using just agents. We are just doing it now through OpenAI. Now I just started a project to create insights, all clients had the same the same insights, now we are using AI to create different insights for different clients.
Clojure, and Python.
Olivia AI —Basically what they did, they connect bank accounts, you give account, I get a little scrap there, get transactions, ETL, disagretation, recommendation, I saw last week you buy something. I know this product you find there is a better price. Tech: NodeJS, React, Python, start a project to make the scrap, Brazil doesn't have an open finance system, back then I have to make a scrap, reverse engineering, all this data.
Documentation — I dont have any technical writing experience but I have to make documentation of everything I do for myself. It is a kind of document.
Salary: $28k reais / $5k >>>> for full time $10k

_____

SEBASTIAN ROCHA — PYTHON ENGINEER
Techstack: Python, Django, FastAPI, FastAPI, Pydantic, BrowserBase, Docker, ECS (similar to Kubernetes), AWS.
TELESIGN —Full Stack Engineer — Now I am working as a full stack with mostly in backend tasks, like consumer facing reports, how we build authentication mechanism for this company, I am building a solution to standardize how the companies around the world. The way in which google handles session between different apps. This is what I am building. It is a Single Sign In Platform. Like Outh0 for example. It is from Proximus Global companies sign in. Mainly FastAPI for microservices. That requires to know some other different libraries like Pedantic,
HABI — Python in a serverless framework, AWS. We basically built and deployed all of our APIs and small specific components, and my main role was to build. There was an internal company inside Habi that does services for loans and mortgages for our customers, we did a product that simulate loans, external banks to be able to do a mortgage. That was the main part, I was a software architect and my role was to standardize the way in which in the team do the software, what are the common practices they need to do to build software, if you need to build a service, sore of a bot in WhatsApp. Build specific information for the teams that were building these software, more of a software architect, also diagrams, build the way in which we are gonna develop software.
MO technologies — Backend + a bit of react front-end. Some Java. — I build a financial Credit Core. It was a huge app that provides some way a foundational system to provide loans, buy now pay later and credit cards. You can basically go to the company and provide some loans to the customers. Every time that wants to provide these services. I was in charge of mainly build some kind of amortization for loans, I built an entire system of loan amortization in Python. React — for some specific parts of the projects we did a loan simulator, we did a landing page, how many installments they would have and how the amortization would work.
Started my career programming sensors, then I started doing web development projects. Also have some experiences with JavaScript.
I am pretty good at Django,
Salary — $3000 >>>>> $4k - $6k
20h hours / week for documentation would be ok but not full time job.

_____

LENYN ALCANTARA __

Techstack: Python, Java, Golang, Postgres, SQL, Redis, Kafka, Supabase, AWS, GCP. Microservices, data, architecture.
ADDI —
I was the first Senior Backend Engineer at ADDI, when I joined they just had 4 engineers. I was the first Senior and Technical Lead, working alongside the CTO.
I created the first architecture of ADDI as a whole.
I moved to Data Engineering because I built a Data Tool, from scratch, when we designed the architecture for ADDi, it was an event driven architecture using Domain Driven Design, using Kafka, for all the communication between domains. All this architecture was made consuming events for Kafka. Previosly my movement to the data team, ADDi was struggling trying to get a funnel to the events in order to know what was happening with the business.
The CEO asked for a real time dashboard about the funnel, how was the conversion for the loans and so on. We had one statically solution, this was difficult to add new attributes to the funnel quickly. The solution I made to solve that was a tool for the product managers, to add stuff in the data dashboard without using technical code.
If you say I need to change the funnel loan conversion to use a new attribute we have in the funnel for the new loan product, for a product manager, in order to move stuff in real time was complex.
The problem was having the info in real time. Dynamic Funnel Data Platform, where you can add data in real time and receive data without any technical intervention. Python, Kafka and Redis.
The challenge to create this was how to handle Kafka from Python, because Kafka is a really fast tool, to publish events and consume events too fast, and Python is not a good language for that. It I not a fast one, Python is good to build products but when you need real time processing Python is not the best option but I used Redis in memory data base. So this is the reason I introduced redid in the middle.
Data Team - I am not doing pure data stuff, after I hired an expert data engineer, he recommended to use data bricks, a framework to have data pipelines, we implemented the airflow, Apache Airflow, we used DataBricks
Not fully a data project but the full architecture of the company around Kafka, which is the architecture it is using. Events are a data thing.
I remember three years ago, the CEO was asking for another solution, another Dashboard with real time data, but the data was not real time data, so I moved all the architecture to a real time architecture in order to provide the analytics team with real time data. This was solved with a stakeholders.
I always work with stakeholders, I was working aside at the beggining using orders from the CEO because real time tools are expensive, sometimes you need an every hour solution.
DataBricks - I am not an expert with it, I helped at the begging to set it up, the tool, at the begging I was trying to understand why I need data bricks, how to use data bricks in our existing applications and architecture.
RAPPI — I joined Rappi when it was created — backend developer, I created all the architecture and first implementation for that architecture. The person from the restaurant was moving the order manually.

At the moment was working for the clients, but for the restaurant, it was different because everyone was using a table. A worker in the restaurant was moving the order manually to have it on the restaurant POS. The human factor in the middle. Slower orders. My partner, I joined with another developer. The solution was how to solve that. And the solution was automatic integration between our system and their POS system.
Every restaurant has their own system and menu. McDonalds was the most important for Rappi and we were working with a customized solution for them. They are the biggest restaurants here about fast food in bogota. A lot of small restaurants to Rappi, the solution for them is different because it was impossible to do customized solution for many restaurants.

SDK to allow to any restaurant to connect with Rappi. When I left it was easier to connect with Rappi. The biggest problem when I left was the integration, how to match, the restaurant Menu with Rappi Menu. Me and a partner, were creating a data structure with GraphQL, to make it easier to integrate their systems to Rappi system.
When the restaurant A, a burger was
It is too painful to listen to the Rappi problems, I don't get how he solved something in an easier way. The solution that I made from scratch was an Inverse API, it was kind of a SaaS, some manual job. Survey and receiving data from the restaurants. Doing et up of menus.
The biggest point. The solution at the end was a data structure called Graph, because every restaurant have their own Menu, but for a lot of restaurant a product has a different name. A data structure were you could. The solution was really good. The creation and configuration of the graph was manually. I didn't create the frontend tool. The team was really bigger than we I joined.
The backend engineers are doing data stuff all the time. When you say
Salary: $8k+/month + equipment + healthcare

MONDAY 21

ARUN GIRIDHARAN — Ohio —
North Carolina — traveling would be good.
AI Engineer — PhD students to do Ai deployment of models, research based development. Current work.
Operations and INfrateam finance timelines.
US Bank — Java backend, AWS, Airflow for data pipelines.
Nina — Data Pipeline and DevOps — data from healthcare, do a pipeline, data per day, Python, core language, AWS, NodeJS. I built the entire payment platform, validating payments systems.
IBM — I was working at building microservices architecture, moving to open source web servers.
Techstack: mainly Java, over there. For backend. Some C#.
Salary expectation — $120k starting place to be deployed.
CV

Isabela Paulino Fonseca — Data Science / ML
TechStack:
Data Scientist most of my career. I moved to AI Engineering. While being a data scientist always learned neural networks and all of that. It is a branding name to the title, but I am working mostly in Machine Learning. I am using APIs from OpenAI, Claude, fine-tune a model, distill models, I am still in the same area.
Dayos — AI Software Engineer — the idea of the platform is integrating ERPs, accounting, HR, finance. I am building an MVP, enable the user to fulfill mount and close, a process of accounting, check all the payments, understand if everything is according how it should be. When I entered the company the process was not established, built what should be fulfilled, what stake holders needed to complete. Agent to access the internet.
Techstack: basically the frontend was built Vercel (this was by someone else), many of the APIs to connect with…
Backend - structure data base neon — AI was a Monolith, track the usage, in Python, ECS, AWS.
Oracle — AI Engineer — It was not a complete technical role, I was the technical person to supports tech people. I created workshops, ppts,
JAI — Senior Data Scientist / co-founder — Jai the idea was to create a platform to upload the documents and do semantic search, so we implemented agentic strcutures when GPT came. I built an agent to find companies for investor to invest on.
Techstack: Python, Langchain,
I try to go to the source of the API and Pinecone.

Nubank — Data Scientist — I did a model that intended to predict which of our customers wouldn't pay the loan, we were accessing the risk, there was a model built for that. Reduce the risk in 5%
AMBEV — churn on customers from the website, model for telemarketing team, they could have more chances to sell online, forecast of inventory.
TOTVS — I built the churn students model.
Salary — now: $8k/month + health insurance of $1k
Remote — because husband is a physicians.

_____

AUSTIN GARDNER __ SOFTWARE ENGINEER USA
CityBlock — I was the tech lead for transitions of care team, anytime a patient get something like cancer. Healthcare companies familiar with it. Anything to reduce the likelihood of someone being not …. Being re-admitted to that case
Data Pipelines, systems and pains, patients, are they currently, migrations on the data pipelines. Data Science team for healthscorescore, machine learning.
My diabetes … data science… business roles, what is the next step. Business Role Engine — different roles for operations people to what steps to do with a patient. Working on different markets. Different markets. How quickly we need to reach out. Specialist. What type of stage, what workflow to trigge, product metric, how to reduce bad experience.
The last quality and risk adjustment team — what increase the cost of healthcare, we are taking on more of the risk, programming r per month, making sure we can understand their conditions, they get care appropriately. Quality pipeline that looks for something like diabetes, what is the care we need to provide to keep this patient healthy. The quality metrics of the insurance company. Are we meeting that criteria. To get reimbursements.
Techstack: TypeScript, Node< react, graphql, GCP, Terraform,
Data Platform side — big query,… apis with outside providers.
Data pipelines in Scala, more recently….
NAVA — I joined Nava, I wasn't doing coding day to day, I was doing scrum master, government contacting, delivery management, the two big projects:

- Quality payments program, apis, data from providers and folks like city block to collect that data about the quality data, care of patients, fee service, you get reimbursed this amount of money, incentivize great care for the patients. Based on performance. Make money based on.. care. What the payment adjustment would be for those providers.
- Migrate the payment systems, over to actual data applications based on AWS. Handon software development, IC and Tech Manager, 5 engineers. I was in charge in a contract with the State of Mass, eligibility for processing of payments

Salary expectations: $215-$220k >>> step from that.

_____

CAMILO RESTREPO —
TechStack: Python, SQL, JavaScript, PySpark, SnowFlake, Arquitecto, AI, LangChain, Azure, GCP, Google, tensor flow, PyTorch.
Salary: $6.7k >>>> puede ser hacia abajo a hacia arriba… algunas ofertas me rechazan por salario

_____

GUILHERME CINTRA — SOFTWARE ENGINEER
TechStack: Java, NodeJS, Clojure, Scala, Flutter, Kafka. AWS. React. GCP a bit.
Backend infrastructure and architecture, some frontend, it is not something I dedicated a lot to, it was more a survival skill. React, Swift, majority of my work on backend with Java, NodeJS. GCP a bit.
It is a platform team for everything.
NuBank —
I am in the foundation team, so I provide abstraction, the bank uses Kafka expensively, there is a lot of abstraction, send a message that will only be delivered in the future using Kafka

The first time I was resposanible for the debit card product, I was maintaining the backend, 60-70% of the work was regulatory obligations, not much product but maintenance.
ZARV — I spent two years building a startup from the ground app, I built all their infrastructure, background checks, monitoring and projects for security of assets like cars and trucks. At some point it was an insurance but not really an insurance product. Insurance companies are a kind of client. Website, you have some cards to keep safe, safe fleet, see a bunch of data about your fleet, you can manage. Security is because if it is stolen we will know and we will inform the police. Backend — how to make it work without costing a fortune, optimization everywhere, we built it using Lambdas,
Next — backend — NodeJS, and Java.
Salary — $10k / monthly >>> around that to begin a conversation.

_____

SANTIAGO JEJEN —
Nevado del tolima
TechStack:
RAPPI CARD — Data Engineering Lead — Separation por passes — we did well and they bought us. We were bought and we are gonna be an independent business — Tarjetas del Futuro — Microservices and put that info into a warehouse, Snowflake, Gt information from our banking core and get this information inside our warehouse like images, pdfs, different info, processing. ETLs. The part that I am doing in Rappi. Relating to the transformation of the data, using Kimbal methodology and Snowflake architecture.
I don't know if this question is related to this specific moment, I am working fo business process, which is risk, fraud, antimony laundering, operations, clarification, BI.
Here we have feature store, imagine that you have different data science teams, one for fraud, one for growth, each team are creating features, number of orders, page. I don't know, If this user likes dogs, or whatever, what is the problem, each team can create the same feature. The problem is you have 5-10 features. Create a tool to centralize features of one team. Period of time for updating, real time and branch processing.

You need this feature for real time, microservices, or you need this feature for a Bach process in general. Real time and Bach processing, governance or monitoring, for me this is an important part. Different pipelines for business risk. The typical work creating models and tables.
First question — How do you implement tools for DBT and Snowflake. For DBT, at this moment, we create a repository for each DBT process and with this repo, we create a Docker image and push this image on a ECR Elastic Container Registry on AWS. At this moment we have a DBT, repo, image in an ECR. WE pull this image and we run this image on Airflow. We create the product environment, the pipeline for CI/CD, for pushing the images, and when you run the image running airflow, these images run on Snowflake, Snowflake are creating the specific solution for DBT, from Snowflake you create your repo and run DBT project on Snowflake using Snowflake. Use data in Snowflake, share the data in Snowflake, good governance rule.
Why are you creating images if Astronomer can work with them? Because it is a legacy process, when astronomer don't have the operators to run the… maybe you think you are over engineering.
ETL — for example Glue on AWS or Spark to ge information from our banking core. Firetrap, Airbyte. TO capture data from our transactional database and put this info into our warehouse. You need ro process images, and transform.
The big challenge is when you start solving different problems and you have a lot of pipelines and you want to monitor the pipelines and you need to use the tools. Data Engineering in every company has storage, processors and orchestators, with these tools is important to have a good understanding and monitoring.
Data infra and pipelines from scratch — we work with providers like Astronomer and Snowflake, we use clean architecture, model View to create an API or a webpage. Our Provider uses our infra.
Related with implementation, Snowflake is a whitelabel, so I proposed different times of implementation for organizing our data warehouse, on Astronomer I am a lead and in proposed a nice

to have for a pipeline, don't recreate tables. On typical pipelines when you have to process images. When we have to get our information from our banking core, transform from a table, you need to use AWS services like Glue and Spark. At this moment, the antimony laundering —the company had a provider but we tried to build an anti money laundering engine, it is get data, transform this data and with the data create different data and reports, so we are using Streamlit, we have a lot of tables and you need to show this information to a business person, with this we can create our engine. What challenges? The typical, a lot of tables, a lot of transactions, working with transactions, because it is a lot of data; the other problem is understanding the banking core and operations; use the data in snowflake and transform this info. How did I face it? I try to understand business data, the process of the company generates the data, so if you create a pipeline you need to understand the financial services industry.
Team — I have a team right now, 6 people. Do you collaborate? How? I work with different parts of the company solving a problem. To create stuff from scratch.
Collaboration —
Data Security and Compliance — Governance define the rules and I try to implement this rules, an user in an warehouse can be an object, a role of each user can be an object, everything in our warehouse is my focus. My focus is in our warehouse, related to our warehouse at this moment, I am working in using Terraform, many poeple use it for infra, but the truth is that you can use Terraform for orchestrating APIs, so Snowflake has a module with Terraform where you can create and monitor with Terraform the objects, to take control of each object, I can know easily when one user was created, who delayed some user. What is compliance for me? It is rules, with compliance you have to know how many objects you have and for example, imagine that you have a table with the number of the credit card exposed, this would be a bad situation for the company, one guy could get the info and sell it in the deep web or something like that, so you need to monitor tables, you columns, this column has somehting exposed, so we have to apply policies for masking, but on the other hand you have the risk team or fraud teamthat needs info for the specific process, so that is why you need to create different policies for this part of the table, with policies. With Terraform you can centralize this operation, a policy is an object and you can apply objects or policies to other objects.
BBVA — for me it was interesting because it was like
Salary: $4k >> I am looking for $6k / month

———————

TUESDAY 22 JULY

_____

MATHEUS MARTINS — iOS Engineer
TechStack:
Since the very beginning I am iOS Native
STONE — Here we have a break even, we can present an idea, that improves something. I was working on the credit module, I realized that it was extremely slow. Smart CI (Continous Integrations) — A smart CI is a name that I built for what to be changed and tested, from 1 hour to 12 minutes for the PR, one of the tech marks, assure that nothing was broke, after my change get disapproval in 10 minutes.Not the entire app but the piece you needed.
Basically the credit module was a part of the app that could offer some loans to the users, is this user eligible for a loan? Let's create an experience to sign in. The taxes, the payments, and at the end of the flow they need to sign the contract to take the loan.
Kotlin platform the logic, but the UI is SwiftUI.

BITSO — here I worked on English. They gave me the opportunity to work on English on a daily basis. I was on the account creation and account upgrade, being able to put more money into our platform. AB testing to see what converts more. Automation, a built a tool called maestro. Apple was blocking our releases, crypto at a time was not well regulated, at a time you have to provide some documentations, see that you are not using the app for money laundering. iOS app was blocked, so

we created a server driven UI, basically the Bitso home app was created in a way that it can update through the backend. Every single place in the app. We released features without releasing the apps. Products: account creations, platform team to build navigation, I worked on the exchange product as well.

MERCADO LIVRE — I was hired to be responsible for the payment experience module. People wouldn't apply like maintainable code. Undesirable behaviors were happening, I was hired to fix this. 500k people use the payment flow everyday, so there was not room for mistakes. I was allocated into a Spanish team. After several meeting with the product, backend and design, we built a roadmap and we made the refactor. I was carried to push the change, a real success, every single scenario that we could handle and fail. This was the biggest company I was working so far.
NuBank —Started his career as Customer Experience Analyst, I translated the feedback that the clients had to the tech team. New Conta, got the feedback from the product, the users like our product but what features we need?
Salary: $20k reais — $3500
$4k
Aiming on the $6000-8000

_____

FELIX RIBEIRO —
TechStack: Golang, C#, JavaScript,NodeJS, TypeScript, Python, Pandas, Django, SQL, Postgres, — Backend
15 years being a programmer, Golang,
NUBANK — Cloud Infrastructure Provisining — I was a tech manager in the team responsible for cloud provisioning, tools, process, all the tools needed to put resources in the Cloud. Our engineering team uses our tools to put their resources in the Cloud. Cloud infrastructure. Techstack: Golang and Clojure. Internal system written in Clojure.
OLX -- I worked here for 5 years, in different teams. I worked on 5 teams. The most important project was a system responsible for the content knowledge of how the meta data to other teams. Define the categories, the products, structure of the listing, re-use this metadata in a specific context.
Team responsible for the technology of the marketing, acquisition and growth in terms of technology. Python with ETLs, to run campaigns with 1 million users. Data base for marketing analysis and segmentation, providing tools for this data, and a tool to massively email the clients.
The main tech: Golang, Postgres.
VTEX — C#, for some business, products there, most important project was in Golang, and Nginx (used to make routing). Product responsible for all the requests, handle it and send to the correct micro service. I built the micro service orchestrator at Vtex. Docker was entering on the industry, I was one of the responsible people to implement Docker in VTEX.
Salary — $5k-$6k.
Ask for CV and questions for role

_____

MATHEUS ROCHA — DATA ENGINEER
Techstack:
FACTORED —it is a consulting company, we are working with clients, working with a client called Moody's, building the data pipeline to the Llm team, data sets for the LLM team to run AI models. They have a lot of data, the LLM team was using some data sets to build models. I was responsible to build these data sets, get data from data source, provide the final data sets.
Curinos - a financial company, you were measures, for the clients, basically they sell data platforms for another financial institutions, I was resposible to build this on the data platform.
Data Engineer to Team Lead
LEMON ENERGIA — I was very aligned with my career goals, back in leadership position, post series A — I was facing many bureaucracy. Many years without vacations and went to Ohio University….

Nubank — started as an Analytics Engineers — Ultraviolet — the luxury and exclusive, high expense people at Nubank, deliver the offer to the final user and also creating pipelines to see how the product is going. Through IPO it was a product that was very important. From 0 to 2 million ultraviolet card holders, 300k active users. AB Testing, best profile to sell the product, understand what the users were needing,
V-LAB — startup, leadership position for the computer vision team. I was working mainly on V-LAB, offer from NuBank.
RAISE UP — data solutions for companies in São Paulo. We started as a service company, and as we got many clients asking for the same things again and again. Retail, healthcare. A lot of contracts. I had 4 employees. AN office.
Snowflake — I am currently studying for the snowflake certificate.
SALARY: $6350 + equity
$7-7.5k expectations

_____

ERIK DREISPIEL — DATA ENGINEER —— TOP FOUNDING TYPE
Medellin
TechStack:
5 years as a data engineer for the
AIMPOINT — Consultant Firm — I worked on many things, client engagements, from Fast Food Bank, Bank, Healthcare.

Bank - I was doing hours sore of thing where they sell hours, helping them with Snowflake, accounting system over into Snowflake, Azure, some authentication stuff.

Healthcare — form the beginning scoping out the project, design and propose solutions for the board, and then it was successful. It was a large migration into DataBricks and DBT, it was very interesting, designing a framework on DBT.

FACOTORED —
Factored doesn't really offer products. Calendat events, some automations on Slack, putting Hubspot data with DataBricks.
Consumer Goods Company — Household company — this was also in snowflake we were dealing with agregation, certain roots from other platforms into snowflake. Certain regions and different rules for each region. Internally I worked on a few projects.
Fortune 500 — Consumer Good, Furniture — Eventually I was moved to a new project Consumer Data Platform (CDP) implementation. Get clients into the system as the company was acquired, we keep them in the loop. That was a long project as well, I was migrating, coordinating, some analytics data, the biggest source of data, that project was very successful. The company decided to de-fund the project, and then
Staff augmentation, for clients, one was a retailer, we were maigraiing multiple pipelines from old system, from Oracle, moving to Snowflake and Tableu. At some point with other members of the team we proposed to implement new pipelines. New platform, ensuring that the data ws good. Eventually I was moved to a new project Consumer Data Platform (CDP) implementation.
INSTALEAP —
Eventually the data person of the company left, I started working with data pipelines, delivering data to clients, I implemented some changes in the way that data works, optimize a few things, adjust stuff. Tasked with hiring at replacement for the data platform. The company started with Big Query, data warehouse sort of world.
I was tasked with integrations, our official API, dealing with clients, implement features and demos, web hooks system, update certain things, order status and order details.

During my college year I worked at a startup in Silicon Valley, I helped integrate Stripe and whole subscription model. I started in Django, Flask, came back to Colombia and started working as a consultant
Salary: $25 million pesos — $ salary integral or higher,
$6k-$7k

_____

SANTIAGO CABRERA — SOFTWARE ENGINEER — DOCUMENTATION ENGINEER
Techstack: Scala, Clojure,
JavaScript ecosystem — I haven't worked with this professionally, at the end is gonna be the same, as we understand the logic of the handling of concurrency. At some point some are the same.
No issue working with the frontend. I don't really have a problem going down to C, I love low level programming also.
Nubank — I got in there, I started in the Colombia team for Bills, what are your transactions for the month, when you receive the extract from the bank, a lot of similarities, I am in charge of the logic of it. Not so many people really understand what you are working on, I develop some facilities to make the developer experiences work better. Now I am part of the Developer Experiences — installments feature, if you purchase a fridge, lets say you're gonna pay in Change installments, you wanna change installments, you can select I want to change the instalments, instead of 2 to 6 so I can make it because I don't have the money. Then Refinancing team, I need to renegotiate my debt. Kafka, Datomic, Clojure.
Hopper — really complicated technology about state machines, it is a really nice idea where your flow, you design it as a state machine, they developed a library, to what is the process, you get into the app and you are looking for flights, that is handle by the library, my job was to integrate information about the airlines, with data available.
I like to get into a complex concept and make it easy for everybody.
TechStack:
S4N — Starbucks — it was changing the whole backend and the handling of the transactions, POS system, where the transaction is gonna happen. Reconciliations. TechStack: Scala, Kafka,
I am not planning to leave NUbank
SALARY: my own pace.
Intro to doc engineer role — I hate documentation, I would say yeah, I can really get things and get it myself

_____

ANDRE GONCALVES ARAUJO — CLARA __ DATA ENGINER
Technologies: Python, Spark, DataBricks, Snowflake, Kafka, Java, AWS. Azure.
Professional experience, Ihave experience building ETL pipelines, processing different kinds of data, data lake EC3. When I was working at Ze Delivery I was using Snowflake.
Data Engineer 4+ years now,
CLARA — Fintech from Mexico with office in Brazil.

I was working on the risking of the company, making sure to create the ETL pipelines. The process is running on DataBricks workflow. Initially on credit risk.
Credit risk - as a data engineer I was more focused, on lets say you wanna build a new data science risking model for predicting risk on loans, but some that data is not available in the data bases. Depending on the company in Brazil you get that data form credit bureaus. Make it enable into our data vases, so our data scientist can predict, if it is secure to provide credit to one client.

Feedback to him: "Mention credit bureaus,… instead of Cerrazano"
Enabling data fro other credit bureau..
More recently I have been working with the data platform team at Clara, making the first something more internal.. making sure that we data engineers, can make things faster in a more secure way.

Monitoring for our pipelines, I made a solution for when you write a new Pull Request (PR) on GItHub we run some data quality test, so it can be faster to implement. You create a new PR.
JUNGLE SCOUT —sell on amazon. The problem has UI, show clients how their business is doing, also having some AI and machine learning algorithms, I was allocated to team to take care of the pipelines that enable the data for some of those products, keywords search volume pipeline.. I needed to build a pipeline to get the data.. it was more related to the business itself, take the best keyword for a product to maximize themselves and the products on amazon. We were using DinamoDB, I needed to work on an ETL pipeline, output of data scientist work, get Tinto Dinamo DB..

On the UI, the client would see how much the clients would use certain keywords to try to find an specific product, the client would use this to decide which keyword they would use to maximize the product the client is selling. My role was basically making sure that the data for this gets into Dinamo DB and in Dinamo DB is the data that goes to this UI product.
ZE DELIVERY — AMBEV business - I was not only working with delivery data but also with data from other logistical or brewery business. Airflow, building ETL pipelines, Snowflake to enable more and more data, others data, data from Facebooks Ads, Google Ads, data that we needed to enable the data analyst with new data that we were enabling to make better business decisions, business itselff to grow and more efective. Enabling data on snowflake.
VTEX — I started working here as a software engineer, when I transitioned to data engineer, we were starting to build a new data infrastructure to the company. Migrating to new data infra. Creating a framework and providing code and providing the code for that. For that I used Kafka, producers and consumers, also another thing was that we wanted to monitor data qualities. I also used Graphing to make dashboards. Here was the main project.
SALARY: $12800 reais + benefits
Expected:

____
_____
WED 23 JULY

_____
FELIPE ESCOBAR — WEB SCRAPER
TechStack: Python,
ZYTE — Giving support to scrawlers of American clients. Big e-commerce companies like Amazon, Walmart, Ikea. Currently we are using the Scrapy API, it is easier to do a crawler that way. It is not difficult to break a captcha, because the Scrapy api supports this. If you have problems other teams solve this
A3Data - Same as doing in Abstract, AI agent to help healthcare communication.
Abstato — I worked with AI Chatbots, improve the quality of responses of the chatbot, some prompt engineering, some knowledge graph to improve the responses, for financial markets. Techstack: qdrant, chromed, lang chain. Some parts doing request directed to OpenAI. Because lang chain has a lot of abstraction.
Nutritive — Intern— raspsible for some APIs, some dashboards, internal apps for the company.
CFIT — Beautiful Soup and Selenium — handle browser, some specific skills. — 1 year
Structure information from sport activities, Scrap info from sport activities websites. Websites in Brazil. Create an application to show these activities. The people who are doing these activities.
Web Scraper skill 6/10… junior-mid
English 6/10
Salary: $3.4k >>> I want $4k.
I am good at algorithms.

_____

DIEGO PAZOS— DATA ENGINEERING
Techstack: Python, SQL, Scala, DataBricks, Snowflake, AWS
I didn't do the Snowflake certifications yet, data bricks and snowflake are very similar. Data platforms. They are building everything that you need inside their platform. Mainly working with these data warehouse tools, and AWS when not. available.
FANATICS — leading digital sport platform — building sports data stuff, related to sports stars, where they are selling merchandise, casino stuff and vetting. Basically everything is related to starting data from sources, a bunch of souces, we are integrating those sources into a data lake to create models for ML, where should we do marketing, where should we do Ads.
CURINOS — data related to deposits, trying to understand how the banks were pricing products, and we created a data set, to see how bank a can see the prices related to the price of the market, show a dashboard to see how they are pricing their credit card fees.
FACTORED — working for fanatics and curinos —
AB InBEv — Logistics data, — BEES app from Ab Inbev — what this app does, show data of what is the best logistics for delivering, for selling, mainly a project related to delivery and selling the products. We were building the whole pipeline, trying to create the architecture, check all the sources that we have, do the transformations necessary. Developing same projects in a cheaper way. Sometimes we have to do things faster. Re-do the architecture to do cheaper and faster.
Compass.uol — Data engineer — we had some clients working ClickBus — bus ticket marketplace. Best Price for the trip that you are planning. The magic about the project is that we had to implement the law of data protection from Brazil, since they were selling bus tickets from competitors, we had to mask the data in a way in which sales team couldn't see the data from competitors, anonymization of data, so some companies couldn't see the data. You would need to understand the law, whole architecture of data lake.
Salary: $6.5k

DEISY VIVIANA AMEZQUITA — iOS — 5 years of experience
TechStack: iOS, Swift, , SwiftUI, UiKit, CocoaPods,
YUNO — it is an SDK for payment orchestration, we are not an app, we are an SDK, pretty much what I do, they already had a product, when I entered here it was 6-7 months old. When I came here I started here I started the CI/CD, they were running some tests, and nothing were working. The whole thing was publishing more versions and they were doing it manual. I grew up it automate tests, I have been trying to grow and I enjoy to build things for developers and for our teams. I am the only one in charge of the CI/CD, other features that I worked with is integrating payment methods, some UI, logic of different payment methods.
Here I have better feedback from my tech leads, I have grown more, the thing that I really like it is that I have an amazing senior here, I have improved my clean code, improved the way that I was coding, concurrency, I have here seniors that really guide me.
I have something missing in my experience is that is working in a big app, an app that is really modular, with so many people touching the code, Yuno is a great and big project as a product, but not necessarily a big app like Rappi.
MUNI — I was the Founding iOS Engineer, the company started with an Android app and one year later they did an iOS app, I was the only iOS for a year. It was my first job, I started the app from scratch, I had the lead of the senior mobile that was guiding me with the architecture, the rest of the code was mine. It scaled, Muni was a project that was more targeted for people with low income, 100-200 people using the app in Mexico, Brazil, Colombia. I was in charge of maintaining the app, all the CI,CD. The app was an e-commerce app, more targeted for the people who sell the products, they give their customers a buchure, and through the app they post the order for groceries. They can see how much they have sold in a month.
SALARY: $15 million pesos >> how they pay, if they pay though deal, I think I would like to get $5k-$6k. I am a Colombian employee.

MIGUEL ANGELVALCARCEL — iOS DEV RAPPI — +7
TechStack: Swift, SwiftUI, UiKit, CocoaPods, SPM, Flutter, CI/CD, Jenkins, BigRise.
RAPPI —
Rappi Loans — loans for users, opening to merchants, Rappi knows how much a merchant is selling. iOS I was part of the Rappi Card product, request, delivery and activation of the Rappi card, from when it was an idea to production.
LEAL — Tech Lead — Android and iOS — I built the rewards platform from scratch,
GLOBANT — LULO BANK — I worked on Lulo Bank — I was the first iOS of LuloBank, I was the founding engineer. I built the whole thing, when I entered we were 5 people until thousands of people. Loggings, Loggings, debit card product, onboarding, UI, security, architecture.
MsC Southern Estate University
SALARY — $7.5k
I am leading a couple of teams, I have done management,

_____

IGOR MOURA — DATA ENGINEER
TechStack:
FACTORED — I am currently in a company, a Client that does search on images and videos — Coactive.ai - Multimodal AI Platform — they have basically have retaild, ads, media, they have a lot of images and videos and they need to build semantic search on that. Find the best images that can explain a prompt. Pictures that match a query. Moments in a video that matches something specifically that you want. Customer needs to send images and videos, I removed everything from data bricks and built from scratch, did machine learning, we run a machine learning inference on that. We work mostly with vision models.
OFFERFIT— Data pipelines, get this data into RL pipelines. Custom SMS message, get this item, get at this count, discount for personalization. Nice company, lots of technologies, however the workload was insane, I got burnout, so I took a break to relax.
RIGHT BALANCE — Client — Luxury Presence.— Automated Websites Creations for Luxury Realtors. — outsourcing company where I worked on a rental house project, you have to register when you are gonna rent or sell a house. The platform was a website for luxury realtors, I had to build a nice data lake, then use it for analysis and build a website of the real person and connect their data. I was a contractor there — the client at the end couldn't get VC funding and they closed.
GAZAHEALTH — building everything from scratch, the data lake itself, ingestion, pipelines, It was a pressed startup. Sadly VC funding was hard, I automated everything but didn't see an actual … I even had to close the AWS account.
IFOOD — delivery startup — wired on the data team, serving over 500 data analyst, Kafka, api, where are our sources from, where do you want the file to be stored, automate the pipeline, build ingestion. A self serving platform for data ingestion, I want data from this source, I want to do this kind of transformation, and I want this table. Selects and joins for different tables, structure from source. Lots of underfeed to automatically scale, airflow, pipeline, lots of actions, automatically… Databricks for these requests. Docker and Python scripts. A Dara lake of 60perabytes.
I started as an embedded system development, I like embedded stuff, I jumped into data. I just finished a master in Machine Learning, I have been doing data ingestions, information to them, so they can make decisions.
$80k year
Inference project ——

_____

NICOLAS SZOLOCH BARRA
I have never worked with Snowflake but I worked with similar things on GCP. Snowflake has some tools equal in GCP. Even if I haven't worked on Snowflake I know some tools that are very similar on GCP. DataBricks use Spark, and I have use PPySpark on GCP, the service is different.
TechStack: Python, SQL, MySQL, Postgres, Airflow, GCP,

XEPELIN — Destroy everything they had, because the company, the monthly cost of the Cloud is the most important. 55k cost in cloud, so I have been making the cost more efficient. $35k. The most important thing is that it involves to optimize queries, identify some best practice to make queries, re-making the data lake, that is the most important thing. The principal tool is BigQuery in GCP, Airflow, Data Stream. We are working with all the data of the company, like invoices data, general data area. Invoices, credit lines, payroll, data sales, customers. I have worked with a lot of data and thins like security governance, quality.
Leading other people? Now I am more a Data Architect role because I am the only Data Engineer Senior level in the company, the other ones, are level 1 data engineers. I have to mentor them. I have to guide them because I have to teach them how data works and practicess I really like that role actually..
FALABELLA — I started as a Data Engineer Senior because I consider myself as very efficient in work. I have the opportunity to fill in that work. Falabella is a very big company. More like migrations I was working on improving the current projects. For example, build a new pipeline, fixing something that someone created long time ago, make it more efficient. I worked with data governance and data quality. The user could find the data and analyze them. Some personal area or business unit that soundly be able to query data in a project.
The problem that I was solving was makingt eh stakeholders to equity data and security things in the time they want it. If they want to query some data from some dashboardds every 5 minutes let's say. They have a lot of KPIs for business units, and I was in charge of KPIs for business units.
DEVAID — IT company, I started working as a Data Engineer here, I had a lot of projects of migrations to the cloud. I specially work with Google Cloud, I have been working with GCP. One thng that I have been doing is migrations to the cloud, cloud in an efficient manner.
The company SMU.cl — it is a software marketing company — Migrations to the cloud to work on new projects. This was my first and most important project. I migrated from servers relational database. To GCP.
I had a lot of other projects too, in devoid, all of them related to the cloud.
SALARY: $4k >>> $5k

ANDRE LUIZ SEVILHA — DATA ENGINEER — SnowFlake
TechStack: AWS, Terraform
AGILEENGINE — I was working on a data engineering team, I was allocated with the data platform engineering, re-factoring the codebase, creating snowflake resources on Terraform. It was more related to Terraform, CI/CD stuff. I have worked on other companies. Building resources, queries, Snowflake, management roles, creating pipelines.
https://www.irhythmtech.com/us/en — Cardiad Monitoring Healthcare — bringing several pipelines that were bringing data from IoT stuff, bringing the pipeline, translating that, data lake and stuff using PyTrend, we were moving data into the layer, then on top, there were three levels of data. The rought data as it is without any preparation with PyTrend, then the other two layers DBT curated, preparation the actual data types, moving the actual data type for each of the columns, the third level was consumption that business intelliegence and analytices guys were going to use, to create analysis in terms of financial stuff , the customer itself, there was like a team that was dealing with customer data, som moving data from pre-aggrefated state to check wht the actual customer were using, how they were performing.

Moving data from one pplace to the other. WE bult a data catalogue, it was a resposability to create a data product inside the team so other teams of the company can use. Grab the data, prepare, data consumption of all the data, my last project it was refactoring Terraform, change in Snowflake, creating the tables, granting roles, policies to the roles, creating views, whatever it was needed. Using Terreform.

Client -

FACTORED — Samsung — the team, it was Samsung Canada, the office in Samsung was dismissed, they are contractors, they were working on a data team. Every product that they were using, every resource was built by us and monitor by our team. Monitoring, Governance. Responsible to apply governance compliance in our platforms. A lot of Terraform. I wasn't using data pipelines with that, inn other projects, only related to data pipelines.
Snowflake — I wasn't using snowflake, it wasn't my team resposability.
PROXET — It was only engineering, and not data platform. We used Snowflake, I created views, pipelines on top of it. A few pipelines that we were migrating for financial reports, prone to automated report, prove that our automated report was going to generate the output with more efficiency. Excel files and graphs into using Python, I was using only Python with Pandas, I had to use Airflow, we were migrating all the data in the old pipelines into snowflake. I built a few graphs, some other stuff on Python.
The name of the client, it was a company in the USA. https://giphy.com — actually they have recently bought anew company and the company that they were working.
BAIRESDEV
AVENUE CODE —
GRAFENO —
I started my career in 2016. Have been working in companies with software engineering and data platforms, creating resources using Terraform, Kebernetes.

Solutions Architect certification. AWS. I worked on data pipeline orchestrator, Airflow. Firetrend. ArgoWorkflows. My main programming languge is Python, Java and Scala. I also started. Few things in Golang. I worked with a lot of different database, relational database, SQL servers, Maria DB, Postgres, Oracle, Interbase, I may be forgetting something.
Slowflake, Cassandra. With snowflake I have
SALARY: $39/hour around $6k > around that $5k starting.

FRIDAY 24th

_____
MICHAEL MARTIN BOLBOA

TechStack: Python, SQL, AWS, S3,
Orchestration I use AIrlfow, Apache airflow, Spark, PySpark, Scala, Kubernetes, Kafka, Databricks, certification with DataBricks, AWS RedShift,
Globant — I am working here, — healthverity —
POMELO — I have been most of the time crating data lake architecture artcheture,
I have built the data engineering from scratch, set up the data bass, the architecture, define the tools, create the templates, the pipelines.
The general problem is related with data, everything was set up and deployed, we have to thinking the future, if that is gonna become large, we need to support that and be scalable, Pomelo is a company that gives you credit cards, little by little we have more customers, more transactions to handle.
Pomelo is a startup that gives credit cards for difference customers, you use the credit cards to make transactions, based on that you create like KPIs, metrics, machine learning algorithms, data lake, the data science team, have to create these models and metrics of KPIs, data sources. From the scratch.
It was part of the contract to encrypt to check sensitive data, we played the data and do APIS.
B89 —
$5k >>>>>>$6k

_____
SAMUEL CHAVEZ — Canada Ontario
TechStack: React, React Native, Python, Django, Flask, Go,
Machine Learning — I was a professor of Machine Learning, from Math and Statistics I know it.

Meta — Technical Writing — Request for Comment, Design documents, Decision Making registering, I was making technical documentation at the senior and staff level in Meta, SignalGateWay product.
Yalo — My role as manager, I was in charge of 12 engineers, UX/UI, when I was working with teams I made a draft of high level architecture, we built the final document for design documents and architecture docs. My role was on the first draft.
Staircase — API for mortgage — here I was working 8 months on the documentation team, I built the website of documentation. Every time that a person on the team, more than 100 engineers. Every time that a pod made a pull request I build the documentation, when the pull request arrived to me I updated the productions documentation.

_____

IGOR ANDRUSKIEWITSCH — iOS ENGINEER
TechStack: iOS, Swift, SwiftUI, UIKit, ObjectiveC, React Native, Rect, NodeJS.
BITSO — I work on the Earnings Product - basically provides a way to get yields from the users balance. Basically the main idea is as every bank app has, you want your money to get yield, whenever money gets in the app, you have a yield system. We can get yields in different currency. I build the foundations in iOS to get yields in differen coins.

EBAY — Contractor — I was part of the payments KYC team, to be honest most of the work was boring, getting banking information for sellers. Sellers in China to get their payments, if they want to take it out they would need to do the KYC, submit their information. I also was part of the Post Purchase Recommendation System, that recomneded new stuff to the user after the purchase was done, with products related to the bought product.
VENMO — I was part of the Business Profile Team — There are some profiles that have special treatments, Venmo provide a lot of features for those users, they were promoting within the app. Business profiles have more visibility with a photo gallery and different promotions times, and protections systems for the products they offer. They can get their money back if there is a scam. I worked across the whole business profile flow — set up, onboarding,promotions, authentication, and security, refunds.
SALARY — $6k/month >> I am looking for something similar.
Next — I would like to do iOS, I have been working with Java, and stuff like that.
DIEGO VELASQUEZ - WEB SCRAPER — BRANDSOLO — View React + Python.
Django,
Python: Python, Scrapy, Playwright, Celery, AWS.
Playwright is heavy formal projects
Brandsolo — Web Scraping — crawlers, spiders, clients, verify e-commerce of products. We say to Google that in their algorithm bring down the rating to products that are not allowed to give it down dare de Baja. Number of crawlers: 132+ crawlers in Aliexpress, Alibaba, Amazon, ArtShop, Ebay, Etsy, Forever79, OLX, Mercado Libre, RedBubble, Walmart, Sezzle,
Salary: $4k
Web Scraping

_____

LUCAS CORACA — WEB
TechDtack
Zyte — Solutions Architect - help design solutions for the needs of the client, I work with sales person all the time, how we can implement the solution that the client needs. The idea is helping dev teams integrate existing solutions with the Zyte Api.
All are web scraping solutions. A technical solution engineer helps the customer integrate the solution with Zyte Scraping API, integrate their process with Zyte solutions. The client doesnt have all the solutions integrated. Example, the solution architect needs to understand the requirements so we can design a good web scraper.
Initially when there is a prove of concept we develop it, architect the solutions.

My job - understand how we are actually scraping that Zyte, what needs to be developed from the ground up.
I think the cool thing is that I saw a lot of different web scraping use cases, I am doing all the weird web scraping projects. I worked on a scraper for a non-profit doing sex slavery and sex trafficking finding people based on tattoos.
Sex traffickingproject / Largest AI Companies to get training data set for them, like Images / crawlers for Fortune 500 commerce companies.
Number — 1000+ web scrapers. — provide a lot of code for them.
ORACLE — Cloud Solution Engineer — infra side, I was doing Could Migrations, when a customer closed the deal, they would get for free, we would be setting up all the infrastructure, design architecture, implement it. Kubernetes, Linux, data base migration, network configuration.
SALARY: $5k >> $6k-$7kk — 1 year — 20h / week

_____

RAFAEL CELENTE — NUBANK
I have been working on AI for about 5 years now. I have been working on different verticals, NUBANK — Research Engineering — frontier side, AI Core — we basically try to do the same approach with what AI models, do instead of language, we are doing a Large Transaction Model. Transaction Sequences. We have % points to all of our credit models, we have improved % points, that means a lot of revenue, both on the research side. Research Scientist, I was doing it for transactions, total amount of compute to see if there is any power laws, total amount of resources that you get from a credit risk model, if you want to scale this model to the same size as language models. I focus on science and engineering, how we can optimize as OpenAI does for these transaction models, so I work on training optimization, working on profilers, optimize training performance… on the inference side, since we have a bunch of tools, trying to optimize models, using tools like vLLM, SGLang, to Optimize these workflows, for AI Core,Research papers to publish.
We haven't pusbliehd but we are cooking up 3-4 paper right now.
My experience has been on training optimization side .. the inference optimization side is related, but still is the same underlying skills. I would like to be more hans on, that is something I
CUDA/ Triton — my expertise here — In the Cuda side of things, one of the steps that we do for performance is to include certain operations in our training pipeline, when I saw our models is underperforming, usually takes about 4 weeks to train in the data sets that we were using and after implement CUDA, we did it in 10x less time. In about a day.
Optimization in CUDA.. Even if I don't have production experience..
Salary: $40000 reais per month— $8k
Don't mind moving to usa

_____

AMIT KUMAR —
TechStack:
Working on LLMs, — n8n —I primary work with LLMs and some customers I need to work on automation tools. Some people cannot afford AWS and so, so we use automation.
Healthcare — chat, classification, analysis. ON inference I work with vLLM, TGI by HF.

When you work with GPUs you work with CUDA, I don't work with SGLang. When you use a GPU in cloud you have to make sure how you write to reach your GPU for your processing, when you use python programming, I use CUDA.
I built on LLM building RAG. I am not an Inference engineer. Of course inference is a thing you do, I don't work 24/7 % in inference.
Inference if you use big LLMs, when you use quantification techniques, the inference speed, good end user experience, quite beneficial for user experience .
Product —
I don't think the company that looks for inference engineer, I don't think I wouldn't be a good match, if the company is looking only for inference.

Ryte —
I am looking for NLP/LLM Engineering Role — starts from data collection to deployment of models, it is not only about research and building end to end product. Working on MVP. My area of expertise is LLMs.
Relocation — needs sponsor.
Salary: 90k-120k

_____

BRAHIAN STIVEN ZAPATA — FULL STACK — NUBANK
TechStack: JAvaScript, TypeScript, React, NodeJS, Angular, MySQL, Postgres, MongoDB, Lambdas, DinamoDB, Kubernetes, Kafka, AWS.
I have 7-8 years of expeerience developmg software — I work as a full stack. For that reason, I have experience in different tech and frameworks.
NuBank — supporting the collateral product, this is a business unit,, I support the product in Brazil, the product is to increase the limit of the card. You havbe the limit inside the credit card. You need to increase the limit, because you need to take a loan. Right now, I support specific products, because if the customer has the problem you need to see if the customer.
I wanna explain my role inside the team, I create the features and resolve the issues. I need to discover the flow, the new feature, the PO, brings inside the teams, I need to take this idea, I need to make the discover inside a milestone. I create the tasks, I identify, the exact errors, inside the projects.

Right now I am working on the exact project inside about the collateral — Collateral handle the credit card, the idea is to increase the limit, my contribution is to create the service about… right now I take the bonus offer of the customer, the idea is to create the flow to guarantee the exact bonus for the customer.
Kushki — I was working on the web check-out — I include the different payment gateways and methods inside the web checkout. I work with credit cards, do the integrations with reedman.
Salary — $10M pesos.
Contractor role — $4k-$5k.
English: 7/10
Silicon Valley culture — 6/10 — still has problem understanding the projects and products that he is working on.

_____

PETR PATEK
Techstack: Playwright, Puppeteer, crawlee, cheerio, got-scraping.
We have our own tools
I am more focus on specific scrapers, captcha, making the scraper human like.
We run our containers, we have some AWS, I didn't built the platform but touched every thing of the business. I took part on developing the tools. Web Scraping Platform, for like half a year at the beginning.
I was supporting the browser tools of the Crawlee and Got-Scraping tool. Most of my work was on the fingerprint tools, makes the browser more human, and make it not automated but more natural.
Scrapers experience — every industry from e-commerce, automotive, non-profit projects. I touched and built from scratch 100+. 10-15 / month. More than 200 hundred.
NDA — but.. e-commerce, Chinese e-commerce was difficult, was the toughest one. Shopee, Temu, Alibaba.
Food delivery apps, like mobile apps scraping, which is harder, quite sophisticated protections.
Websitres that are protected with datadome and akamai tool were the most difficult to scrape but I did it.
Salary: he hasnt said

_____

GABRIEL GRECO — WEB SCRAPER

TechStack: Python, Scrapy, Selenium, Puppeteer, Playwright, Electroneek, n8n,
Other: Pandas, scikit learn, Tensorflow, Nummpy, SQL, MySQL, Postgres, MongoDB, Redis, React, NodeJS, Express, Nest, Lambda, RDS, AWS.
LUMA — Web Scraping — extracting data was the easy time. Over a 100 projects at Luma. Today at Zyte we only work with web scraping.
Zyte — I deal with tickets with scrapers that have been done. From Amazon, Bookings, Trip Advisor, Walmart, Carrefour. Open browsers, browser less, api, data. Like 30-40 web scrapers. Today I had 8 tickets, they are from 8 different projects, Indeed, Carrefour, we are scraping those sites. The architect develop everything and I fix it.
In Loma I created 300-400 web scrapers, from banks, for government sites, the industry was car insurance, I had to take a lot of data from government. A lot from government, banks insurance companies.
Automation and bots to buy things online, and then after that I joined a first role as a system analyst, they asked me to to automation to insert data in systems. I started working on Selenium.
I have done 1000+ web scrapers. I started creating bots for Nike.
Salary: $3.5k.. Looking for 30%-40% more

_____

SERGIO FAJARDO — Data Engineer —
TechStack:
Factored — Senior DE Manager — 7 people team. Databricks, Azure, PySpark — Working on org culture — Project is Solar Energy, solar energy farms, retail, companies, data platform. We are working in a company that builds it.
Healcrare — was, airflow, python, Postgres, MOntecarlo— manejo de leads for healthcare projects - 8 people from USA, Spain, warehousing architecture — Snowflake? We were migrating to Snowflake. \
HCL —
Snowflake — lo he trabajado mucho, lo puedo agarrar sin ninguna pena.
Salary: $12k

_____

_____

TUESDAY JULY 29TH

_____

CHLOE HE — INFERENCE ENGINEER– still didnt interviewed her, we re-scheduled.

_____

EMMANUEL ZAVALA — Data Engineer CLARA — 10+ years of experience

TechStack:
I started as an ETL Developer.
CLARA — Data Engineer — We have ben dealing with a lot of different technologies, started with AWS, S3, Lambdas, Databricks, Airflow, Terraform, Kafka, S3, almost everything in data bricks.
Snowflake alternative — I think we can have everything… big data tools, I think DataBricks has almost everything.
I am the manager of data engineering — I am responsible for all finance and risk, for those teams we do solutions related to data,, ingestion, transformation of data, making data available on the meta base. I have now two people on my team, I decide the solutions, provide management, two teams, provide with all the technical solutions that this team needs. All the necessary data, people need, generate all the data.

For Mexico my resposability is getting all financial info of the clients of their finance, so they can create insights and risk models, so we receive info, transform it and use it, if we can provide some products or not.
I have automatized getting the financial data, in Mexico there is a government institution where you have to pay taxes and I automatize getting that data and make it available for the dashboard and the data for data science models.
We are making AI tools to automate, contact users, review results, in order tohave data available for everyone. We try to make it easier.

CITIBANAMEX — Owner of the Big Data Platform, whole platform with Google Health. 16 people at the end. All of them from consultant companies, I was the responsible to the platform. I needed to learn more technical stuff. TechStack: Spark, Python, SQL, Claudera,
Datio — I started to learn a lot of big data, one step order, I went to Citibanamex, I was the owner of the
Salary — $5.5k — >>>>>
Expecation $7k

DIVAKAR YADAV — INFERENCE ENGINEER
I have not officially graduated, I finished almost all possible credit for my master, I need to finish my thesis, my university has this requi\
UWM — Master — Major AI LLM, my focus is you call specific. Amount of credit. Distributed system. Lets say you are using ChatGPT BUT THE COMPANY HAS A POLICY that some of your workers.. why would you bring Chatgpt in house, our own cloud, to take care of data. We have to deploy LLM, they are currently no more than 30 users. In case it would need so many memory. Our job is to reduce the cost and optimize, so more users can accommodate, I am writingg custom Kernels, looking at the parameters and matrices. See if I can improve the inference time or not, Cuda Graph is an approach I am using, you can capture sequence of events and you can do it in one goal. One by one sequencely, and that takes 15 milliseconds, if you use CudaGragh, it would take less than 10 milliseconds, the challenge with this approach, it predicts the next outcome. We can accommodate that within the Cude graph.
CapriGlobal Software Engineer — a bank, with insurance and real estate, Django, Python, MongoDB, Kafka, Kubernetes. 15 different products. LMS — Loan Management System — they wanted to build an LMS in-house.
Udaan.com — my job was developing backend apps — B2B marketplace, sellers, my team was catalogue, listing. Different stages. Microservices architecture.
My job is
Salary: $160k in the Bay Area.

WILL FELIX — FULL STACK ENGINEER
TechStack: React, NodeJS, TypeScript, JavaScript,
NuBank — Clojure — I am a full stack, but most part of my time is on backend. It is using Clojure. IN mobile app we use Flutter. All the companies I worked at, I was using JavaScript.
I am currently wealth and protection. My team is responsible to present the product, all the things built inside NUbank and put it on the mobile app. The protection page, the page about security, insurance and the page of investment. Modules. We are resoposible for the header of the mobile app. The information of the header is made by my team.
THOUGHTWORKS — Consulting company — Main client: Natura — I got into two projects, these two projects I was using JavaScript, I always worked as a Full Stack. Often have to help with Frontend. The natura, I was working on the mobile app. My second project was on the architecture, NodeJS, I was more into the communication between the services, AWS.
CLUB DA COTACAO — This was a freelance project I participated, my time, was the mobile app as well, working on React Native, sometimes, build something on the services it was PHP. I was

responsible to build the CI/CD tool, every time a dev made a feature and put it on production I used my cicd project.
COMPLEXO — Educational that sells online courses for lawyers, it was my first company in the area as a developer, started my career in Ruby on Rails. After that I started to program in Java. We migrate to microservies using Spring. Then using Angular.
Salary — $15k reais — $3k dollars

———————

PRATIK DOSHI — INFERENCE ENGINEER
Techstack: vLLM, NVIDIA TensortRT, Cuda.
SO I have been doing inference over a year now, I was doing a lot of graduate research, LLM work, inference should be better. I did an internship. Using models and benchmark them. Recently
COMFYUI — it is my job, speed up the inference, help them scale inference.
I have a working knowledge of CUDA
Master in University of California — AI in general. Inference is a big problem and got interested on it. ML system and make it run faster as it is what is stopping us.
I have contributed to LLM projects — ongoing contributions, video tool, you have a text to video model, quickly preview the model.
I have a couple of months.
Salary: $75/hour — $144k
I am looking for high learning opportunities.

———————————————————————————

SAHELI BHATTACHARJEE — INFERENCE ENGINEER
TechStack: Python, tensorflow, Huggingface, C++, Java, Bash, React, vLLM, SGLang, GenAI pod, PyTorch,
KRAI — Boston based startup — end to end deployment of ML models in hardware systems, inference. We collaborated with Google Engineers, I was responsible for vLLM GPU, deploying those solutions with Google Cloud GPUs, I am resposnsible for running the ML inference at data centers networks, I have used vLLM, SGLang. Cuda - not writing Cuda but I am working on GPU devices.
ParkSmart — developing smart parking solutions for customers — I was building custom, making model, vision models, custom database, annotate. Different data sets, color detections, I trained the model so it could detect cars colors and made by which company, brands, model.
Beofre I was a master student at the university of Liverpool in Advanced Computer Science. I was doing AI stuff, for multi agent system, data structures, security based studies.
SALARY — $100k+
Cambridge UK — want visa sponsor

———————

YUSUF ANI — INFERENCE ENGINEER
Inference Engines — I am those to use public models, interested, but not as an inference engineer. I am using it for my agentic purposes.
Cuda — I would like to learn — everyone wants someone that writes these kernels.
Innospere AI — fully focused on AI agents, developing agents, we passed the MVP, the first one is whenever the is a car to car accident, predict amount of the cost. We are trying to assist those people, agent RAG where we have the closest scenario. I develop, agentic chatbot for a university, queries about lessons, employees of university, automatically re-direct them to the pages. Right now what I am doing is there was assessment comany. PDFs. Lots of figures and tests, they don't have data layer. Mostly writing an agentic chatbot to answer from tables,… questions about reports, or generate reports about KPIs or info from industries.

I anm working inference tools for all of them. IN all the three projects we are not allowed to use any APIs. That is why I am using them. I have to configure them because we have limited resources.
Quasara — Research deployment — data labeling company, companies come with the data, they want to find, clustering, clean data and find the only important parts, this for search and customers write. Filtering data for big leaning pipeline.
I worked for two years.. I did my thesis in there. I started working…
Master — TUM technical university of Munich
Nova Research —it was a university job it was more of a research thing. It is not one of the best papers.
CBOT — this was a chatbot company, they were running with ML models, and they wanted to move their models to deep learning models. I fined tuned classification models. Ofc I was also involved in different projects. I worked for ecommerce, I was involved in SearchDeep, they were training models that I was responsible for cleaning data and maintain those models. I implemented from scratch. I worked on NLP, where you catch color, brand, etc in users queries, capture entities. Search classifcation problems.
Salary — $90k - $120k —
If you look any job that say it is an agent implementation… what I am doing 1.5 years. Just vLLM and SGLang.
MlOps is a different thing, I help orchestrate. I use vLLM as a tool. Send description.

_____

CHLOE HE — INFERENCE
AWS — expert models — general trend, using experts architecture. Optimization for models to run and achieve comparable performance with GPU standard.
I was interested in in lower level inference optimization. Have a lot of learing opportunities. There are new models coming all the time. I am I the part of the company that likes more startups. Maybe new models don't come out of the box with performance, so there is a lot of investment in this area to achieve comparable performance. We get to learn across the stack. Hardware levels, Kernel, model architecture their models.

We don't use Cuda, we build our own chips, we have our own language, the idea is youre constrained by your hardware design. Right now the hardware that we do iterates very quickly. The models comes out and different architecture. The hardware cannot be too generic. What the commonalities…
I think inference is very interesting. I would def
Claypot — large scale low latency platfom, a lot of that process, going as the first employee I was doing a bunch of tasks across the stack. I think after the startup life. I was doing big tech
Bioinformatics — Models from different applications
SALARY:
I have spoken with a lot of startups — it depends — stage of the company — if I have equity in a seed stage. Series A company is not the same. Across different companies
$200k base and depending on the stage of the startup.

_____

WED 30 —

_____

LORENZO FAVARO — INFERENCE ENGINEER / AI ENGINEER
More of an AI Engiiner / agent builder
TechStack: Python, LangChain, LangGrapgh, LLMs, Mistal, Lama, vLLM on Lama, LangGrapgh, GenerativeAI, RAG, everything regarding that. My background is on computer science and software engineering. Related to software engineering rather than just AI
Inference — working on open source models, how to deploy different kind of models, the main thing that me and my company is that the privacy is becoming the most important thing, most companies want to shift to that, run their own models. Working with Italian universities and they really care about the privacy of their data.

REPLY — I am working on a new apporoach, the LangGragp approach, we are working on how to extract knowledge, we are working extracting pdfs, excels and so on to our Grapgh, first step is data modeling. We are working with Langchain, I have been working on the last month on small project, a smart assistant that helps you planning your meals. You want to have a list of recipes for your needs, able to have a shopping list. Buy all of the product. This assistant does exactly this. I work on internal offerings.
Projects — Zeiss, Siemens. BMW, Porsche, Wolkswaguen.
Meal assistant — multi agent system, 10 agents that communicate with each other.
vLLM — not in this one because we are using proprietary models, Openai models that are already deployed in the infrastructure.
Small models — a model of max 20 billion of parameters, deploy it on our infrastructure.
I worked on vLLM when I was on Italy because we were testing different models for the university of Bologna, have an infra that have whatever models in their own infra. I tested a lot to of different frameworks.
Cuda: I am not working with Cuda. I havent worked on that on the low level.
SALARY — $90-100k

_____
JULIO GOLDBACH — reschedule didn't arrive — inference

_____
NESTOR CAMELA — iOS Engineer
TechStack: Swift, ObjevtiC, SwiftUI,
STORI — I am in the home team, we are coordinating how to navigate with the home, back and forth with product and business team. We created a server driven UI, change without having to depend on a release. My main focus is home, but also works with login, deposits, mini services like payments, design system. The server driven UI is the most consequential thing I have done. Now they can change anything from the backend. Build new features thanks to this fuctionality I built.
MERCADO LIBRE — I was working on Mercado Pago Wallet, we did a lot of collaboration with Mercado Libre. They were building the vertical within the app. I was building some stuff from scratch, new features starting everyday. It needed a lot of work, maintenance and refactor. Bill Payments, transport payments, parameter system. Build internal libraries. We had to add new features on Objective C.
Mercado Pago has a vertical for food delivery, it was the first within the company. I ended up, a little bit with e-commerce in Mercado Libre, internal library of Maps. A lot of things from scratch.
TREGGO — I was the only mobile developer — Delivery app for e-commerce. They grew up a lot during the pandemic and they needed to scale the app, the wasn't maintained properly for like two years, basically we had to re-do a lot of stuff, needed a lot of new features. In the beginning I was the first, then there were tow guys more. I did a lot, NodeJS with MongoDB for new features. I ended up doing frontend on Android and iOS. This was an app that was there for a lot of time. It was Android and Java.
English: 9.5/10
SALARY: $4.5k >>>>

_____
ALEXIS GUERE — FULL STACK/ Backend //
React / NestJS. TypeScript. Preferncia a backend.
Techstack: JavaScript, React, NestJS, Node, JavaScript, data base, Casandra, MySQL, Postgres, Oracle, DinamoDB, MongoDB, AWS.
RESERVI — the current place where I work its a reservation platform. It is a new product that is not launched. I am currently working as a Tech lead, mostly backend but I take resposability for the whole project. Frontend is on React also, I am not dive in the code of this project but I have regular code reviews. Sneaked in the code, internal standard.
BAIRES DEV — Notomnia -- Internet provider telco—The last previous, reserve, working as a .. I created the mobile api side, we had 7 microservices, I built a new micro service, was intended to be

the gateway for all the mobile application functions. Invoice payments, CRM product. I was in charge of the API side for the customers app. How much of your internet plan have you used.
DRATA — AI-native platform for compliance and risk management — metrics and suggestions — they had some really big clients, in charge of the new version of the app. They had like one year old from the launch, and they were creating a second version, more reliable, I was in charge of a couple of modules. Trust Center Module, which is like a public dashboard to show how compliant they are in the frameworks they use in the company. Take private info, search and map it to see if they are compliant with standards. Multiple Tenant Module - it is like you are Cocacola and Femsa you have subcategories of companies, you can use one subscription for all your companies. Techstack: Nest
CLOUDDB — I was the lead developer of all the development, CloudDB is a subscription, they are like a private Reddit, I was in charge of building that from the egging. Tech: nest
SALARY — $1.5k
Expectation $2k-$2.5k

_____
MARJORYE didn't arrive to interview

_____
ISRAEL SARAIVA — SOFTWARE ENGINEER — FULL STACK — front-end
TechStack: Javascript.
INFOSYS — Belgium Telco company that works on the mobile services — I started working for them on frontend with Angular, after a couple of months they wanteed someone with backend experience, Backend developer. Technologies for the frontend was Angular, now it is Springwood Java, NodeJS, GrapghQL… Integration with government because there are several ways to log in, user name, also there is another way to log in, which is a government application, Belgium is a different name, gov application, certification, gov ID, all information from the government, just for the companies to have more security when logging in apps.
Today I am involed of the registration of the user - signup, onboarding —
DUSTIN — e-comerce app, I was working on NextJS frontend, that is why I left because I was not being challenged there. It is a company form Switzerland.
SHELL ENERGY — I built a backoffice app from scratch to manage consumption of energy of B2B companies. I sed Kubernetes. We managed all Kubernetes. Golang, NestJS,
TOPTAL — https://ultraspeaking.com — Ultraspeaking — I built re-built their application from scratch and I was the main one building the frontend app. Only version only user React, and we built together a new app using RemixJS, they wanted to have freedom on the real time applications. They wanted to have the possibility to work with real time data. Tech: React, Node, Express.
QUICARGO — it is a logistics startup in Europe. Matches who wants to deliver with transporters. Improvements on their web application. Angular. Refactor the application to use the new angular version.
RAPPI — I built from scratch their backoffice app, to manage deliveries. Mostly frontend. Tech stack: React, Google Maps API.
Location: Netherlands

Salary: $100k euros —>> $
Ask for CV

_____
SAUL URIAS — 7+ years as iOS
TechStack: Swift, Xcode, UIKit, SwiftUI, Combine, Objective C,
Design patterns that I know.
LOVEVERY — Then Lovevery contacted me. They offered better. Improved the benefits and the salary. I was part of a small engineering team, building the entire app pretty much. I mostly focused on the functionality that allows parents to join subscriptions. My team was focused on mobile app, which is a digital content to learn how to grow their kids in montesori style. App is personalized based on

parents needs and children age. Integrate the apple framework to allow users to purchase digital subscriptions.
LYFT — Business Program Team — as a Lyft user you can be a business user. When I joined I joined the Business profiles. Allow user to take rides, invoices and taxes directly to their companies… payments module, in-ride. Core functionalities of ride.
When I joined they had the ability to create business profiles in the web. So usrs would have a link from their company and they had to do log in and validate email. What I built was the functionality of joiing to the business program from their app, coset up business profile. Golden path, because they don't need to switch profiles. I worked on a solution where a single user can have different business profiles.
BITSO — 3rd iOS engineer — it was an MVP when I arrived it already had millions of users, I joined in a critical phase of the company when I had to lead the team for scalable solutions. Build a more robust architecture, I integrated unit test, design system definition.
I joined to the deposit and withdrawal team, which is the main team. I was part of the Core team.
Salary — $6k/month — depending on the benefits more or less. 7k if no benefits no vacations.

———————

JULIO GOLDBACH — AI FULL STACK ENGINEER
LLM/AI Engineer Elixir Engineer / Inference? / backend Elixir / Full stack? Yes. Focused on backend.
TechStack: Elixit, React, NestJS, Python, Flask, Django, FastAPI, PyTorch, PySpark, Spark, Tensorflow, HuggingFace, vLLm, SGLang, MCP.
I have more experience on the agentic ai side. I have deployed vLLM and Slang. When they do internal stuff. But my main expertise is agents, fine tuning, promote, evals, using the APIs of base models. Using the LLMs, but not as much as deploying stuff and doing clusters. Short overview of my career, I have worked in a few companies.
HAKKO — Senior AI Engineer — it is an Israeli software house, we do different projects, and I started doing AI stuff. We do it all. I do a lot of AI.
I build RAG, chatbots, internal air, ai agents integrated with bigquery data, orchestration, fine tuning, distillation, cut cost. I do a lot of stuff. I deploy internal agents.
We had one client, Aerospatial industry in Israel, 10000 of employees, we built internal RAG for the documents. Internal documents of the company. We also did another chatbot, a simplee chatbot, central bureau of statistics, we did an internal chatbot for them. I also did AI agents that send a newsletter.
vLLM/SGLang, I didnt do much, I just deployed it, what is the hardware that we have, one RAG, virtual machine… reduce cost. How do I use cross GPUs, how much can I allocate, limit the inputs going to the LLM, capture the metrics, the LLM is outputting. Little inference experience.
Cuda? Not, never. No experience.
BANCO BS2 — Senior Software Engineer — acqired Weel — I was responsible for creating the whole accounting product system — Now every single thing we do, reflects in the accounts of the bank, they didnt have any engineers working on accounting. They gave that challenge to me. I was working from Brazil and I understood the market. I could speak Portuguese, Hebrew and English. I built huge project. Mission critical, in the backend using Elixir. I also did some React.
WEEL — b2b fintech — a lending business — invoice discounts, tech factoring business with machine learning models — They got acquired by BS2. I worked across the whole code base. The whole financial backend was on me, all calculation logic, LTV, and so on, it was me because I have a background on economics. I did 90% backend. Tech: Elixir.
Salary: $7k-8k/month expectation
Relocation: open to it but needs to be a good salary.
Algorithms — I can do lit code, I know data structures, binary search, etc.

___

THURSDAY 31

MARIO ELORZA — iOS AI Engineer
TechStack: Swift for iOS. SwiftUI, SwiftUI, SwiftTest, StoreKit, HealthKit, iOS Foundational Models. Generalist full stack engineer. React, Angular. NodeJS. I moved to the mobile field and I started working with React Native. Then Swift for iOS. SwiftUI, SwiftUI, SwiftTest, StoreKit,
Foundational models inside your application —
Quibika -- I am using the apple intelligence LLMs and they work locally in the device. I am working for a startup from the US. IQ Motion — not yet in production. Lavarage motion technology to understand how you are playing tennis, sensors, motion processor that translates that data into information, to give insights and recommendations on your tennis playing.
My suggestion is not using it from the app, having a backend. The whole time the same company. Some initiatives inside the company, I did research on foundational models.
SUMUP — global payments engine and POS — we were building a digital account for merchants in Chile, all the money and transactions go into the digital. iOS. I worked with the team in Bulgaria, I participated in a Hackathon and won the price, for the best project, for the merchants.
I was part of the global team, we were working on the digital account from the baking team. I built the Transfers product to send money to other people and the digital debit card.
Betterfly - unicorn startup from Chile — it is an insure tech company, more focused on the health side, based on your good habits you earn some coins that you can use it to give away. The business side, if you consider what is an insure tech, when a person has better habits the risk is lower, with that the company can increase the policy for more coverage. We were a small team of 2 iOS engineers, we built the whole app the two of us.
We had a design team and we followed the guidelines that they gave us, it has Home Screen and a tab bar, very user friendly, we focused a lot on transitions to make It look more soft, we discussed a lot of usability things with the design team.
Next - I can understand other things as well.
SALARY — $5.3k >> %20% increase or so.

FEDERICO JORDAN — iOS Engineer' — 12+ years
TechStack: iOS, Swift, SwiftUI, Objevtive C, NodeJS, Android, Kotlin, Java
BITSO — leading crypto exchange in LatAm — I have been in many squats. User Squat — , then to Saving Squat. I also worked on the Core Squad, which is the developer experience for the mobile, which we had automation, CI/CD, implemented localize tool for helping with localization experience to developers. I also migrated the CI pipeline from Bitrise GitHub Actions. I am now on the onboarding Squat which is KYC.
PEDIDOS YA — I worked mainly on the wallet — I built the whole wallet in Swift and Objective C, I also did CI/CD pipelines. Being involved in this kind of tasks. Automation stuff for developers.
OLX — It was mainly the users experience squad — authentication, validation of the profile and all KYC —we started with a product called let go, working with many people from Europe, Asia, Africa. We had different devs around the world. My role was mainly iOS Engineering.
I also like React Native — on freelancing projects.
SALARY — $9k/month and I would need $10k-11k.

ANDRE BONFATTI didnt arrive to call

_____

MARJORYE CIARDULLO — WEB SCRAPER — TOP CANDIDATE FOR DIPLOAI
TechStack: Python, Django, FastAPI, Scrapy, BeautifulSoup, Selenium, Postgres, GCP, Kafka
JUSTBRASIL — mainly Python, Scrapy, BeautifulSoup, Selenium, we deal with Brazilian court websites so we have lots of problems resolving Captchas, we need to interact dynamically with the websites. Mostly Pytho, Postgres, Redis, Metabase,
I have two jobs here - I act mainly in crating web crawlers to collect data from Brazilian courts, over 300 web crawlers, we need to give lots of maintenance. I also design APIs. This web crawlers need to connect with other microservices for sentiment analysis, and other services built in house, to extract those sentiments from law suits, I do some dat analysis when I need to do it for the product team. Sometimes we need to log in to get credential from the law suits, get documents, and so on. Resolve captcha, we have another service and tools that use AI, for data analysis and insights of the court cases.
We have these two services that I use a lot - resolve captcha, in many ways, because there is many kinds of captchas. All is communicating by apis
BIRDIE - Customer Experience startup — Feedback analytics for Product Teams — I did almost the same thing, I built a crawling architecture using Python, Flask, FastAPI. I collected e-commerce comments - we collected comments from different products. It will give me comments from your product. We had three steps. The first step is accessing the website and getting all info relating to the product, access all those products that we need to collect, always based on categories, notebooks, smartphones, dishwashers, we had categories based on what the client would need, then all that info about the product we start to assess those comments, to see if positive or negative.
Scrape e-commerce websites — I collected over 100 web crawlers, every crawler has over 100 websites targeted. I collected data from all around the world. So it is close to a 1000 crawlers.
NEXT STEP IN CAREER — here in Brazil we have some changes going on, I won't be able to work on web crawlers, mostly with data bases and data analysis, because they want to put AI to collect those datasets that we need to collect. That is why some employees are going to other teams. I really want to work with data extraction. Risk - not yet a risk, I have a lot of context about the tools that they want to replace. I need to pass this knowledge to another people. JustBrasil isn't doing lay offs lately/.
SALARY — $3k-$5k
Short term projects — it depends I would need to see more about the project. If it was interesting.

_____

ANGELONI CUESTA — FULL STACK
TechStack: JavaScript, TypeScript, React, NextJS, NodeJS, NestJS, Python, Postgres, MySQL, Redis, MongoDB, DinamoDB, Express, AWS, GCP, Firebase.
BELVO — I work on the direct debit product, we charge for our customers, maybe 100-200 thousands payments per day, I started that product from scratch of the team. Consist in lets say youre a money lender, you need to charge to them, automate it to their bank account, so basically the product charges for customers that don't want to pay, we have a lot of users. I only worked on this prodct and I am the founding engineer of this product.
AKTIUN — Virtual Analytics Data Application — it is a company that do data analytics, build dashboards, and diagrams based on your data. Represent the data on diagrams. Mostly I was working as a full stack, there was not really a backend because we only process data from data bases. I created new diagrams.
TANGOCODE — Ramp up project — Ads Manager Product for Meta, Google Adwords, Snapchat — you want to post many ads in many places, this platform helps you orchestrate the posts you want to do across platforms. Mostly Ads for Real Estate.
When I started working there the project was already robust so I worked some features like support, scalability, and I added the TikTok and Snapchat Ad manager. It was an integration. Also we added some automatic video editing product to have better quality ads.

SNAPEATS — a product I released in my country. It was a delivery app built on React and NodeJS with Express, Firebase, GCP. With 20k+ users in 5 cities. More than 500 orders per day.
Relocation —
Salary —

LUDVIK PROKOPEC — WEB SCRAPING — APIFY
TechStack:
Finising master degree. Building scalable apps.
APIFY — I have been working 6-7 months for them, building web scrapers, automation tools for everything. Every scraper. Each website. We are also building proxies for scalpers. Rotate apis, access the pages. I am mostly doing the Proxies work. We are building Super Proxies, from data center and residential. It is really fast to process the scraper through data center process. It can be blocked and you can access the website. Access website by residential. Other devices that can access the internet. Homes of the people, provide us the device to access the page. If the scraper is broke we can rotate the api, to connect to other proxies.
Web scrapers from scratch — we have a javascript and python library to build web scrapers. You can use the library to create the scrapers. Use the tools to scrape.
Mainly I work on the proxies but I have also built scrapers. I scraper for page rank scraper, page algorithm for google to get page engine optimization, SEO score. I have built instagram scrapers.
With the library crawly, the page rank is the algorithm defined by google. The scraper doing the work, it goes to the website, goes to the next pages. I am building graph in the memory. Get individual pages of the website.
Number — 3-4 scrapers in APify. IT is easy to do because the library. It is really easy to create scraper. It is really isn't everyone can create scraper, we also created LLMs for AI.
Scrapers use proxies to get the info of the pages.
Every scraper use our super proxy.
Every scraper I use a proxy, because every web can easily block the IP address. Know if it is a bot.
You need a proxy to scrape the website.
How many scrapers use Super Proxy — we have like 9000 scrapers so 8000 scrapers use the super proxy.
3 devs use the super proxy.
I think I can build something similar because I know everything about it.
Proxies prevents you to be ban.
Technical Challenges — plenty of algorithms, the page rank algorithm.
I am building my own scrapers. Before Apify I was a full stack dev.
You need to know how things work. You can create the scrapers. Proxies to access the pages.
Salary — $9500

EMILIANO MALLO — iOS — PayPal/Tienda Nube
TechStack: iOS, Swift, UIKt, SwiftUI, Swift Concurrency, Combine, Carthage, UITests, XCUI, RestAPI.
VENMO — Working in the Crypto team — I built PayPal Rewards, I built the experience and focused on the experience for iPhone. My main experience was the crypto. Recently PayPal launched its own cryptocurrency, and now we are trying to add blockchain network stop transfer with lower fees.
TIENDANUBE — Senior Manager — I received a team of around 15 members and I grew it to 50 people. My role was in architecture, I was having a lot of design conversations. We were working on having our own payment gateway, we were trying to build a lower level layer for our own. We also created the app for the merchant managers for stores. Another team scaled from PHP to Scala. I was writing code in iOS.
OLX — I had the listing team in charge to sell different products in the platform. Mobile app.
Codika —

SALARY — $9k/month — 20%-25

———————————————

ANDRES CALLEJAS
TechStack: Go, GOlang, Ruby, Ruby on Rails, Kafka, Elastic Search, MySQL, Redis, Postgres.
GLOBANT — GO Dev — Disney — Go, but the last year from November there were no GO tickets. We are working with the POS (Point of Sale System) for the parks. There is a big monolith, and we are migrating to micorservices. Sometimes we need to fix things. I am working on Configuration Hierarqy for microservices.
RAPPI — User Core — Supporting most of the products in Rappi — we were the orchestrator to call microservices between back and front — it is the path where the backend starts, a lot of movements because our work was not directed in the frontend. Other microservices were after us. We were the front to communicate back and front. Kafka, Elastic Search, MySQL, Redis, It is kind of a pipeline to receive info from products to show it in the front. We had kind of a pipeline, info from sources to pass.
GROWTH ACCELERATION PARTNERS — the client was ProofPoint — https://www.proofpoint.com/us — Account Managing Product — Digital Communication Governance — analyze images, and texts with AI to detect treats. connection between social and professional network s —manage protectional accounts for people, help you do reports, what you can post, professional networks. The main part of his program was in Ruby. Was starting to learn some Ruby.
SALARY — $ 12M pesos with prestaciones sociales —

———————————————

YIMING CHENG
CS Predoc —
Tsinghua University —
LMCache — Distributed cache like Redis for distributed data base, it is a distributed engine for Inference.
vLLM — the fastest inference engine ever — you want to know. Every company wants to do this, to serve customers, you need to calculate, to make some responses, there is some users, you are user the LLM what something is, not to calculate something for the same user, re-use the cache. RE-useed to make the inference very efficient.
Production Stack — it is more a product.
Paper — LMPrefill: Inference Engine for Refill-only Workloads in LLM apps.
Recommendation System for LLMs. You can ask the LLM. Engine beautiful scenario, we use vLLM, LM-based recommendation models is of high quality. Just change. Totally new recommendation system. If it is cheaper. Train once and deploy millions of times.
LMPrefill —
SALARY — $150k + vis support

———————

ALVIN VINOD —
LLMs to create formulas, inference.
vLLM to do inference. For that one I am also trying to experiment.
SGLAng — have explored but I am working with vLLM.
Cuda? No, there are some custom methods I have implemented.
$60 pounds per hour
Full-time —
I think of the use case. I am quite familiar with it.
Adult entertainment industry —
$50k-$60k pounds.

———————————————

TOMAS PEROTTI — Lead iOS Engineer
TechStack: iOS, Swift, SwiftUI, UIKit, ObjectiveC.
COMPASS — housing marketplace, crm app for buying and selling properties. — I helped built CRM, email engine to communicate with clients, user activities, notes, I was building mentions flow, to tag clients. I am building an imbox inside the app. Contact activity fee, it is the product of the activities associated with a contact, if you have done a call, a house tour, or anything related to a contact. I am in the Inbox which is like making a WhatsApp inside the app. I am leading one iOS developer.
POMELO — SDK company to help fintech launch financial products — this was my most challging experience, founding engineer and tech lead, CI/CD. Developing the iOS architecture from scratch, networking, analytics, server driven UI where you can renderize from the backend. I built the product from scratch as a founding engineer. Netowrking / analytics, SDK. KYC —Onboarding for clients. Visa and Master Credit card SDK, the flow of getting a card, activating it, using it. Apple Pay and Google Pay integrations. Building all the SDKs to provide

KAVAK — it was short, I was on the Core project, re-defining the architecture, user server UI, flow of customer journey, from start to end, from the stage where you are, if you have to sign a contract, scheduling product to see a car.
NARANJA — fintech debit and credit card — I joined the early team, I was the 3rd iOS Engineer. Redefining architecture. Clean architecture. I was on Visa pre-paid card. I built the mobile point of sale POS with a device to connect to cellphone for merchants. It was an SDK with Blootooth, to charge with the NaranjaX app. I also contributed to other modules such as the design system of UI.
SALARY — $7k/month >>
I am trying to understand the scope of a project.

ENGLISH —

RENNE ROCHA — WEB SCRAPER — Backend Engineer // Fullstack (React) basic react knowledge
TechSTack: Python, Django,
XOMETRY — Backend developer. I have no web scraping task. They don't do web scraping. I do some consultancy.
Marketplace for manufacturing. I work on the pricing team. You send your part and you get a quote, usually an automatic quote, I work with the team that gets information. I work there and I maintain the service that does the process for the price for the customers. Pricing team — 5 engineers — pricing engine. Mainly Python, I am more of a python developer. I work on implementing, maintaining, improving.
Internally we get info from other microservices. We have a service that analyzes the parts, open the CAD files, we get info, and present a price, we have a lot of logic to calculate prices, and validation, pricing is responsible to return. We have a lot of data science model, and most of the time we create a price that has a margin for us and to pay to the company.
SHIPPO — I was working at the integration team. To integrate with the carriers, you can send the packages to other places, Shippo finds the best courier to send it. Integrations with companies like DHL, etc. APIs to get information from this. I would send from this code to the next code. Get information for all of them and provide a price for you. Working on this integration team. We also do some consolidation work.
CAREERIST — I was doing some training, and python teacher
SIX FEET UP — Consulting and different projects on web development with Django.
ZYTE — I spent a lot of time. Joined as a web scraping engineer. I was working with professional services area. If you need data from any I would create spider to get the data, the format and processor. I was working on e-commerce scrapers, Amazon, Walmart, in the US and Europe and even in South America. 100+ scrapers. How complex were they? Niche e-commerces. Food

companies, pet companies. Entertainment like IMDB for movies or shows. Rotten tomatoes. Worked with bets. I was keeping a team, it was a big company and they wanted to scrape data from entertainment, what people are saying about shows. Series, Movies. It was a major streaming company. And they got data from any kind of website where you could put reviews about a show. Personal Project. I maintain a project called Querido Diario, we scrape public data from Brazilian cities.
SALARY: $6.5 anything above that.

———————————

JIMMY SANCHEZ — RAPPI — PERU —
Techstack:
RAPPI — Full stack and engineering lead — I led the team fraud prevention team. I spent most of my time at Rappi leading fraud prevention, with 5 backend, 3frontend devs, and 2 data analysts on my team. When the customer makes a transaction we need to see if the information that the client is doing or saying is true.
Fraud prevention product — Information from the customers, evaluate that information. Retrieve information from different points, we can call APIs, data bases, in order to get information, application that we created, we built a rule engine, where we prepare the info and then with a workflow, we have to send the order information and it is evaluated in the application, for example, an evaluator that evaluates all the rules in that specific workflow, and we can do it in less than 400 milliseconds. Keep the user in the transaction, so the user don't cancel the order.
A simple customer can order one or two bottles of something, evaluate in the transaction if he has a coupon, discount, something suspicious, there are a lot of rules, we develop the engine, evaluate that information. Microservices created for that, the analyst and the functional people do a rule with a particular language we created, a language for that kind of rule configurations. What I told you, respose time is very important. Try to reduce the number of share backs. When the user don't recognize something they report the bank and the bank call the apis in oder to get that info. If we don't have that info the bank pays to the customer. We try to do and ensure, info updated, we can prepare some evidence. Provide evidence for chargevbacks.
Chargebacks product flow — if the company has a good chargeback system the customers like, Rappi is trying to reduce it.
Chargebacks flow - we automate these flows, because before that, Rappi had a team to do that manually, they resend mails from different banks, template, convert to pdf and send back to bank. It was a complicated work. Then we use some technologies in oder to automate some processes, we use a table in a data base, an input, that we have to get a bank request. Reduce that in a micro service to send an information daily, in oder to process that info in a micro service. The next micro service is getting that information, a java library, from PDF, use some templates uploaded in the system and then we use that programmatically, information from database, when we have that, when we have that information, we have another process there, pdf, we are using, some design pattern, to solve that problem. We have different channels to send the information, by mail, another, get the file from amazon stripe bucket, we have different channelswhere we send the information.
Chargebacks product flow —
Transactional evaluation —
Fraud Alert Notification to different teams to check
Curriers Evaluation of Delivery
Customer Delivery Check
INFOSYS —
Startup Engineer — 6/10 he has worked at a startup but not that dynamic

———————————————

JUAN SEBASTIAN GOMEZ TORRES —
Techstack: React, DinamoDB, S3, Lambdas, AWS

RAPPI — Cargo Team — Last mile as a service — when you order by the rap app you get delivered by rappi curriers, if you order by McDonalds app you can also get a currier from Rappi — so it helps other apps deliver through Rappi. Integration in an API way. We can show the allies all the orders. Cargo was like 300k dollars in revenue / month for this product, I developed all the financial micro service, show the clients how much they are paying for the orders, the main goal was to show them how much they were built after the order.

NestJS, TypeScript, Docker, I also had to do some tools in frontend in React.
I helped build the cargo product, I was doing some features of the last mile as a service product in the beginning then I built their financial micro service for last mile as a service. I am the tech lead of the financial part.
Orders per month - I know that we are billing something about $2M - month. We went from $300k per month. SO I Helped scale it. From SQL query to move to a Microservice idea. 99% of accuracy in the migration. Doing reports was a challenging part. Main information. Work on an environment, where most of the tasks aren't well defined. You need a financial microservice to show the clients the financial info. Having to thing ahead of the main goal is the most challenging part. We have to ask a lot of questions like trying to understand what are fictional and non fictional requirements.
CLEVERLYNK (acquired by Rappi) — early hire — restaurant selling and marketing app — it was a software as a service for restaurants. We were like the Shopify for restaurants — integrations with all the marketing tools, and marketplace tools — we were like 6 developers. Over there I started as a frontend dev using React, then I passed on the backend, we did everything in Lamda functions, we did server less.
I was mainly working on the catalogues/menus, upload new images, home page, landing page, you could enter to the menu, delivery.
MO — Internal teams for the team, devops process, Microsoft teams app so we could deploy. Django, Python.
SALARY — $4k/month >> If I would move only if something, the acquisition hire got with.
I want to buy stocks.
Hiring bonus — 30k stock options.
ENGLISH —
CV —

MONDAY 11 AUGUST

OMKAR SHEWALE —
TechStack:
SERVICENOW — building AI Agents, we are having problems with latency and I am doing inference. We are improving latency in the models. 50% improvement. Basically, we are doing, optimize,.. utilizing inference servers basically.
Cuda? I am working on that.
vLLM — yes, not for our use case, but we are using similar tools, hosting multiple models. vLLM just allows LLM, it was not compatible with our models, Nvidia Triton, that supports different models. It is similar.
Apart from that, some of my friends have their inference server. Our own custom built inference server. I am contributing to that. I haven't used it yet, I haven't used it.
Infornio (not open source yet) —
I know the model architecture of vLLMs.
SGLang — I am not quite familiar with it, if the role is required I can learn it, I like to learn new technologies.

I like startups, I live this kind of work
Location — I would like to move, but I would stay in Chicago.
SALARY — $140k+ — I am open to discussion. I want $150k+. Visa sponsorship, I don't require, I have my visa for more than 3 years. I don't require for 3 years.

_____

TREVOR GARRET —
TechStack: Python, FastAPI, Django, NextJS, React, TypeScript, PHP, Postgres, MySQL, MongoDb, AWS.
People Data Labs — aggregate data — customer deliverables, on website, me in terms of full stack, I handle authentication, all our payments, access our data and make purchases. Better returns. Internal company tooling. Get people access to and things like that
Authentication, Payments, Consumer Tooling.
Consumer tooling — tools that allow our customers to use our products. We sell an API access. For example sales force app to consume our data from sales force, targeting non technical users to they use our platform more.
I built the Dashboard, the sales dash which is our internal tooling, I handle all of the stripe payments.
Prosales — ERD system open source, similar to salesforce and hubsport, sales and accounting. All in one software. Manufacturing companies that were very niche, it required a lot of development work. Unifying it and getting it more modern into the Javascript ecosystem. Create more dashboards for our users at a glance see informations for the different aspects
Salary: $180k+
Ask for CV — good candidate.

_____

DANIEL IVAN GALVEZ LEON: 15+ years. Java. Spingwood.
TechStack: Java, Springwood, C#, PHP, Ruby, JavaScript, Python, Kotlin, MySQL, Postgres, Oracle, SQLServer, Casandra, MongoDB, AWS, GCP.
XEBIA: worked for two clients —
Halo Branded — https://halo.com — the reason why I am looking for a new opportunity. This is a legacy project. We are doing an old migration, using Java7, jQuery, the code is not a good code. I am working here on fixing bugs and adding new features.
Urban Sitter — https://www.urbansitter.com — Uber for Caregivers for children, pets, old people and house services. — I liked this project, I learned a lot. In this project, it is a uber for caregivers or pets, and initially I started working on backend development with Java and Kotlin, all the new stuff that you have to do, you have to do it in Kotlin, they work with Java, Kotlin, MySQL, GCP, Redis, Docker, the web project is built on Angular, React. They wanted to migrate everything to React. I worked here building new features. For example, the features to the admin, they have the admin tools, to do payments with Stripe. Payments with credit cards, migration, Stripe, they wanted to use cash app, google pay and Apple Pay. Frontend and Backend, new features on admin tool to do reimbursements, payment admin. For example
Xebia — internal project — sef library — we were working with chatgpt — When I worked with them I was working on that library, doing integrations with Google apis, wikipedia apis, I had to create a little application, a demo for a bank using that library. An app where you can chat using natural language. You can ask how much I spent in utilities last month, only with that input we output the answer. Using the library we infer the answer, we infer which is last month,
FRUBANA — Backend — JavaScript, Java, PHP, Postgres, and Kafka, AWS. I worked with the procurement product and prices. They changed the name to purchases. I worked on NodeJS tech and Java, fixing different bugs, we worked with an external tool, it was for the warehouses, we had to connect. Integrations with warehouses and inventories. I also worked on the admin project as a full stack, which was built on PHP, Nodaframework, a little easier to do front-end.
GLOBANT — https://www.linkedin.com/company/3cinteractive/ — 3cInteractive — I was the backend. Java, Springwood and Casandra. The app was, you have a store and you are suscribed to the product, with the product you can create discounts for the store. The people subscripted to the

app, the app detects that you are closed and the app sends you coupons and discounts. I was able to purchase different things using google pay and Apple Pay. I remember that the application was connected to google and apple wallet.
ESPN — two years — I worked with Groovy languguge and using Java and Kotlin, we were migrating the pages of the statistics of the main sports in USA. Tennis, golf, football, baseball, basketball. They were migrating all their statistics tables. There were three projects and applications, I was on the middle of frontend and backend. The frontend and statistics, baseball sports, for specific team, and specific player.
HopeDepot
SALARY — $16 million 500 pesos. 4.5k I am looking for 18 million. $5k as a contractor.

_____

MANOJKUMAR REDDY —
TechStack:
KUNAI AI — Consulting firm and AI company — high tech companies — we host those projects for our clients. AI for the banking sector.
I am working on operations, ai and infra side. To set up LLMs for our projects, Hugging face, vLLMs, let our engineers use LLMs in our projects. Using different resources on AWS. Otherwise I use, point to our developers, maintenance and monitoring. Infra work.
vLLM I deployed most of the LLMs in our instances, LLama3, I worked with other LLMs like Mistral, when I deployed there were a lot of challenges. If I am a developer. We can find the doc recommendation, I need to do a research, deploy on EC2, AWS family.
NVIDIA H100 chips, I worked with all the chips available and GCP. Cuda to deploy LLMs. I worked with Cuda mostly for vLLMs. Define some difficulties.
3 years. For 1.5 year I am working mostly on the Inference Optimization Engineering. I am expert on AWS and multi cloud environments and Azure, our team, wanted one engineer who had experience in Cloud, so they offered me to set up LLMs. Most of it is infrastructure and optimization. To deploy an LLM it takes a lot of time to answer a question. I optimize it using different methods.
Not Open Source — my company policy is not working on Open Source
More challenging position — I want to dedicate on ai and research —
SALARY — $ 220k+
+_____

RYAN SEONGIN SHIN — AI ENGINEER — NAVER KOREA
I want to move to the USA. But now I am more open to remote.
TechStack:
Since becoming a leader, I have been wanting to develop more.
Inference Role — I know vLLM but this is not my speciality.
My speciality is for pre-training. Build an LLM like ChatGPT. Build like a ChatGPT from Scratch. That experience is kind of unique. That is difference. Training optimization. Also build the data from scratch, make the Chatgpt from Scratch.
Most similar role is Research Scientist, Python, PyTorch, Cuda, Distributed Learning, Distributed System Optimization. Natural Language Processing. Spark,
I am open to any skill set that I have.
SALARY:
$100k // 140 milion won
He will send CV, info from huggingg face and research paper

_____

SATYA SAI PENNAMAKURI —
TechStack: Python, PyTorch, TensorRT, Triton, Onnx, AWS, Azure,
7-8 years on AI stuff — I have been working mostly on Computer Vision models, and transformers. This is my first time doing inference optimization. Before I was doing more research, how to improve

accuracy. I have experience using AWS Lambda, and ML services that clients use. Not direct customers, but we have other businesses that use us
WAYVE — it is not GPU, it is the embedded GPU, not server style. Small enough to fill inside a car. Here the inference is not in the cloud but on the actual car itself. Nvidia has a GPU called ORIN for autonomous cars. Our focus is getting the latency down to as low as possible. The prediction needs to be very fast. We do low latency. Specifically I am leading the role on quantization. I am trying to bring down the latency. One practical challenge of this embedded is the bandwidth is lower, from one to another gpu, you have to reduce the memory usage.
I am Tensor-RT, which is similar to it. I haven't tried vLLM. Tensor-RT itself has the same features. vLLM is for LLMs. We don't use vLLM. I think it would be quite fast because once you know one framework very well you can transition to the other one. The underlying context and concept is all the same.
Cuda? — Cuda is one way to program kernels, there is another way called Triton. I am familiar with Triton and gives you similar benefits. We also use Cuda but we selectively use it. If there is something Triton cannot do we go to Cuda. From the practical perspective is 10x easier to implement in Triton vs Cuda.
TRACTABLE — Applied Scientist - improve the accuracy of the models. Let's say someone gets into an accident, the car gets damaged, based on the photos we generate an insurance claim. A computer vision app. My work was increase the accuracy of that, and deploy in the cloud to implement with different clients. We served insurance companies around the world.
PyTorch, AWS. Lambdas. Step Function. ML Infra / Research. We had our own internal versions of PyTorch.
SALARY — if it is relocated would need to be higher — if it was a remote role.
$90-100k quite low for remote —
Remote — $150k

MUHAMMAD USMAN — WEB SCRAPING ENGINEER
ZYTE - Data Extraction — ecommerce, marketplaces, we are using Scrapy + Python + ZyteAPI + ZyteCloud for hosting spiders.
We did Amazon, Walmart,
Job directories like Glassdoor.
Doctor directories — get data from fellowship, experience, personal data from their websites. — https://kyruushealth.com
UberEats, Delivero, OLX.
I have worked with almost any kind of website, we don't do LInkedin, because of compliance issues. LinkedIN policies are very strict. We used to scrape if some client asks but now we don't do. Anybody who is scraping Linked will face legal issues for LinkedIN.
I bypass Captcha, did proxies, responsible to get rid of this.
There are some websites that are very difficult, they implement antidote protections. Walmart is very difficult. Amazon is also becoming difficult. Not allowing after a certain page. Apply different filters. Different kind of ways to get more data.
I was working on a project that has 2000-3000 bots in one project. 5000+ Scrapy spiders. I have written 100 times amazon spiders with different inpu, with different kind of data.
SALARY — $70-75k euros. I want to get more. It would need to be around. In Zyte we have job security. Other bonuses.

ALEJANDRO MILDINER — BACKEND ENGINEER —
TechStack: Backend, Java, Python, FastAPI, SQLModel, Flask, Pandas, Scikit-learn, Postgres, AWS rbs, MySQL, MariaDB, AWS, GCP.
Past — Data Engineer.
RENVANCE — real estate investment — we tokenize real estate assets and sell them in little shares — it is like buying bitcoins, it is having apartments like company shares. Platform — I built the

platform and migrated it to AWS. All the services are in Python and NodeJS with TypeScript. I built the smart contracts as well. Lambda functions. Api Gateway of AWS.
Sign up for users, authentications, deposits, marketplace, tokens, integrations with banks.
FRUBANA — I was in two teams, I was on the finance team, invoices team, for Mexico, Colombia and Brazil. Then I was in the AI team, where we build a recommendation engine to know which products to buy from which suppliers, how long do they take to provide us, what products we need to buy together. I was building the pipelines for the apps, the backend. Python, Pandas, Scikit-learn.
JP Morgan Chase — I was a couple of years, started in the exotics trading — it was a financial product that include buyer options. Options for buying bonds and shares. I was on the trading of products. I built the trading engine, we received the request of buying and selling, we matched for processing the transactions. We built the intermediary service for trade and connected with bookkeepers.
Second was for FX — currency trade platform — giving users of JP Morgen to have parental control for their own users, for example provide controls to traders fro Banks to what they can do with the bank money.
SALARY — $5-5.5k

_____

JAHNAVI REDDY — WEB SCRAPER
TechStack: Golan, gocolly, chromedp,
Freelance Project — Right now I stated working as a freelance, we are a small team, I was a freelance on the team and started working on this project for one month. Python and Playwright. I am doing testing. I use ReactJS for the testing. Motorcycle parts data — the client project. They need some particular data.
FISSION INC — I started working as an intern, I started working initially building an app. JavaScript app. Then I was offered as a full time employee and started working on web scraper.
CRMs and automation tools, they need the data, we started working on that. If I had to speak about the tech stack I used Golang. 3-4 months. We did background research on a website, we made a whole document, navigation, what website, what links, things like that, best part. We are pretty much on what we call the speed. Maybe the GOlang was very good. We started doing it with Golang. gocollygocolly, chromedp. The targeted websites have so many bot protections. Back in that time we used Selenium but didnt work so we used the Golang tools. I was working on projects targeting real estate data, like Trulia, Zillow, .
Visa to work — OPD —-3 years of visa
SALARY — $85k
Located: Alabama + open to relocation. How fast? ASAP!

_____

TOMAS SEXENIAN — WEB SCRAPING
TechStack: Python, Selenium, Playwright, ZyteAPI, Scrapy. MongoDB. Postgres.
Playwright for efficiency reason. Also mostly ZyteAPI. 2Captcha.

Zyte — we do web scraping on demand. Even in the case for projects that are already on the way data structures change a lot, so non-sql is easier for us. We don't only do web scraping, we also do data validations, data analysis, we do data validation with Pandas. I actually do it faster, we run things. Some things we do on Google Cloud. The data of servers stored in Postgres instances.
I do Web Scraping - that is what the company does. Project for the client, for a certain amount of time. I also play a big part in data quality automation. My job basically is these kind of projects revolves around finding ways and creating processes that use data science, automate data QA as much as possible. We are building what we call Virtual Quality Assurance Engineering. This system is an AI version of a typical QA. Webscraping data, how it should be done. Pandas. Finding a report and post that report.
My job is 50-50 between data quality and building — it is mostly e-commerce web scrapers — Walmart, Amazon, Target, IKEA. We do have some other projects that involve government websites,

a website form the state of California that has information of renovation jobs that contractors do on homes and gated communities.
Complex things he can bypass - Captchas, proxies, you don't want to request much because you are gonna be blocked so I do rotating of IPs and user agents, we face Captcha issues, 2Captcha. I use AI. I use a lot Gemini and OpenAI APIs for performing web scraping. We have a solution called AutoExtract, that automates a lot of the web scraping code implementation, which uses ML to automate web scraping. Lets say you are scraping an ecommerce and you want to know the product name, so you put AutoExtract on natural language to extract the names from these products.
AutoExtract — using LLMs for web scraping — I helped build it and I am using it.
Zyte has two main business branches — web scraping software and web scraping services. I help build web scraping software, like AutoExtract and ZyteAPI.
50+ Web Scrapers.
GENEXUS — Backend Development, The Nexus — similar to WIzz, a low code platform.
SALARY — $4k/month >>> $6k
Contractor — 6 months and then focus on college.

_____

GUILHERME MARQUES — BELVO — BACKEND ENGINEER AND AI ENGINEER
TechStack: Python, Django, DjangoREST, FastAPI, Docker, Docker Compose, Postgres, Terraform, DInamoDB, ECS, Lambdas, AWS.
AI Engineering - Postgres with embedding support — pgvector, Google SDK, Dspy.
Dspy — it is like LangChain in some sense. You try to abstract some of the management that you do with prompts, the whole idea is to program more than prompting. Program not prompting. It is more attractive because it is easier to manage, trying to optimize the words and strings in the texts.
MLFlow — software to manage LLM usage, also used for machine learning engineering, but also for AI engineering, to see traces, do experiments, evaluate how your pipeline is doing.
BELVO — My main role is I am a backend, I basically take cate of our public API. Whatever you do with API integration, you are interacting with me. I deal with all the components in the system architecture such as the cache, our database, our database is huge, I am one of the people that do AI Engineering in the company.
We are planning to release an agent soon, a customer facing agent, I am using FastAPI, MLFlow, using Dspy. Everybody is learning how to do agents effectively, atomic agents that do very specific things, and then you can do a workflow that do more complicated things. I am building an agent, which is our first customer facing, we intend to help customers reduce their time to go live, integrate as soon as possible with the agent. Right now we have a chatbot that has access to our product information, our documentation, the bot is gonna understand what you intend, how knowledgeable you are of Belvo, how we can help you to integrate as fast as possible. The time to go live, as soon as someone do a contract with us we want todo deployment faster.
INSTANTEASER — I was the 4th employee and first technical hire, I was that kind of first tech person, I did software engineering, did ML, Data Science, deployed a model. They have come up with an optimized pipeline to do motion design videos. You ask what you want, send to motion designer, get a video, you can ask for feedback, and get your final video. Building motion design videos and I built the software to make this true.
Techstack: Flask, Postgres, AWS, Jinja (html with Python), JavaScript.
SALARY — $5.5k >>> I would change for $9k.
Relocation — SF — yes —would take a month.
Move - I enjoy working at Belvo, something I value even further, in Belvo we have a strong sense of helping each other, not so competitive but collaborative. But I am open to changes. I

_____

DIEGO ARMANDO REYES — SOFTWARE ENGINEER / BACKEND PYTHON
I have experience in backend with 10 years ago, working with Python.

TechStack: Python, Django, Flask, DjangoREST, Postgres, MySQL, MongoDB, Redis, Lambdas, AWS.
 XML, Soap Library,
BOLD — I connect external services to the devices, I developed a product to manage the devices, we have devices for payments POS. I build services and components for backend for POS devices. I built these from scratch. In Bold all components are microservices, so we need to build tools to integrate the components from other teams. I build the tool to connect with other data and other services form the company. I also worked on synchronizing data from other components like the payment, the merchants, bill reports.
TPAGA — I worked on integrations with bank entities. I developed some APIs services, to connect, with the services for bank entities, to create accounts, queries about the balance of accounts, create users in the bank software and create services to the app in android and iOS. My main contribution was with Banco Caja Social, because I started from zero a project to create new accounts in that bank, create users, bank account, query balance, do transfers. Here I was mostly on the API and Integrations team.
GREENSILL — startup for factoring — building the backend of a factoring system.
NOKIA — Backend in Python for Inventory Management, ERP and CRM.
English: 6/10 can communicate but not that good. He can say things but feels the friction. Sometimes he doesnt understand my questions.
SALARY — 20M pesos >>> 25%

_____

MICHEL RIBEIRO — BACKEND —
TechStack: TypeScript, NodeJS, GO, Python, MongoDB, PostgreSQL, Kafka, MongoDB, DinamoDB, Redis, Clean architecture, unit tests, CI/CD, Docker, Kubernetes, AWS
FRUBANA — I have worked 2 years in Frubana, building a team, for buy now pay later product, a business unit called FruPay that offer credits for the customers.
Tech Lead of FruPay — We built the entire ecosystem from scratch, Lambda function, Postgres, Dinamo, all of our services are built with NodeJS and TypeScript, event driven arquitecture approach to integrate our services. 20000 clients that use our product everyday. It is in the Checkout Process. We have a payment method called FruPay. NodeJS is the mode mostly on TypeScript. Some services on Python and go. But mainly node.
ZAK — Restautant Management for Restaurant — POS for restaurants — the system and app that work on the device. We built from scratch, we used NodeJS, for delivery integrations we used Python, and we also have an ecosystem for payment process which we built using GO. Event driven architecture approach using Kafka with our event broker.
CUBOS TECH — some projects with a company — POS for bars and parties — https://en.zig.fun — I helped develop this. I bult the backoffice service. For managing financial bills. I built the entire business logic and services for the back office on TypeScript/NodeJS.
SALARY — $6k - $8k/month
Relocation — no relocation .

_____

YU—HSIANG SHAO
Compatible with other companies —
Market range. My current plan is to do part time until December.
One lecture with master degree — current plan is to enroll, graduate, if there are alternative jobs.
This year part time / next year full time
Visa — I am F1 visa — 3 years opt work
vLLM / SGLang — 5-6 months
Cuda — no experience with Cuda
Time to disaggregate — vom —

_____

LUIS EMILIO REYES — FULL STACK — Backend

TechStack: React, NodeJS, TypeScript, GraghQL, MongoDB, Postgres, MySQL, AWS.
ENCORA — https://www.productplan.com — I built the platform, for project management, backend and frontend. I move on any language. Ruby on Rails. I prefer to be with NodeJS. I built three features — I was working with InApp notification, push notification, implementing surveys, n tabs of different. Re-design of section. Ruby on Rails to React, Editor of text, Better user experience.
PostAccuteAnalytics — https://paanalytics.com — arhivos, integraciones, aseguradoras de usa para aceptar procedimientos.
QUIBIKA — Ruby on Rails and React, after that moving to other client, MVP project for integration, social media, for american artist, Will Smith, using NextJS. https://www.eastgoesglobal.com — MVP to connect, sell a % of Will Smith in some city in Asia. Asia don't have american social media, collect all the data, to sell campaigns. Influencers.
YALO — Ecommerce company that creates ai — COcaCola, I developed a chatbot for CocaCola Nigeria, b2c costumer applications. TO deliver at your house.
Salary — $5.5/month. Expect a little more. I have local holidays but don't have any time off. Just laptop to work and local holidays.
Relocation: If I get a sponsored visa — yes.

_____

DAVID LEON — SOFTWARE ENGINEER — BACKEND ENGINEER — SUPPORT ENGINEER
TechStack: JavaScript, NodeJS, Kotlin, Springwood, MongoDB, PostgresQL, Redis, Kafka, AWS.
RAPPI — I work on the support area, I work programming for customer service, to support buttons, and if somebody talks with an agent I solve these problems in the app. All automations in the product are implemented with developers. Screen records, automate the compensation of users if something goes wrong.
In the products, the user can contact support, depending go the automation, we can help the user. Compensate the user if a delivery went wrong, also if we need to send info or settle info with the store.
IBM — Full Stack — Angular, Java. AWS. Kubernetes, S3. I was working for Bancolombia. I was working on admin apps, CRMs, etc. Custom developer. IBM provided the developers. I also worked on cybersecurity.
SALARY — $8million colombian pesos — I want to increment to 20% 2k to 3k…
Relocations — YES, eager to relocate.
Ask for cv
So so English

_____

JAVIER BARBIERI — didnt attend the call — not necessary to re-schedule — so so profile

_____

MARCO MURAKAMI — SOFTWARE ENGINEER— Node/TypeScript 6+ years
TechStack: NodeJS, TypeScript, RestAPIs, Java, Postgres, MongoDB, DinamoDB, Lambdas, Docker, Kubernetes, AWS, GCP, Azure.
LUMENALTA —

BOUNTEOUS — agency — I was assigned as backed engineer for delivery food companies — I kept in touch with — Danny's https://www.dennys.com, https://wingstop.com.mx, https://www.redrobin.com RedRobin.
It was a lot of stuff, we manage and host the web application and business logic, on the frontend side we had the web page, so we managed all the logic behind their delivery. I built loyalty workflow, a little bit of the log in, paper client ID, payment info. APIs with third parties. We used Auth0 for authentication, Sales force.

PARAMOUNT — Validity of the services, I built some automation in order to assure that some services are ok. Scheduler, if the app went down or we have one person assigned to check that out. I was in charge for the automation of that. Ensure that all the apps have all the necessary things.

Integrations

YALO — Third parties to build WhatsApp bots, different companies contacted us and if they wanted to make some adjustments for bots we had an in-house team that does that. We wanted to build a web app SaaS, so they can build their own bots, so we had to manage it in a way that it wasn't that technical drag and drop platform, all the configuration, choose what would be the best approach, the architecture, the data base and what data base. I helped built the conversational workflow platform. In nice months we built it. We were like 8 engineers. I was on the configuration part. I had the webpage with all the modules.
KONFIO — Build AWS lambdas, work on the funnel web up to validate and approve and reject customers credits.
NEKSO —
CLIP —
SALARY — $5k >>> at least the same
RELOCATION — Only Remete Jobs — would move.
ENglish: 9.5/10

ANDRES BANNURA — SOFTWARE ENGINEERS — FULL STACK — With Visa in USA.
TechStack: React, React Native, TypeScript, Golang, Ruby on Rails, Python, NodeJS, Postgres, Redis, MongoDB, DinamoDB, S3, AWS.
Amazon SMS,
H1/b1 visa
NIRVANA Insurance — Backend focus — no infra but business backend, I work on the Pricing Engine, fully on the backend part, creating the pricing engine, how much we charge for new quotes. Golang, no special frameworks, we build our own in-house frameworks.
FINTUAL — Ruby on Rails and React Native and React — the last year and a half I worked on a project just me and another engineer, we developed the Stocks Product — we offered the. Possibility of creating their own portfolio, we integrated with external brokers, we created the app mobile, transforming the currencies, setting the stocks, getting the USD, deposits and so on. Basically before that they only offered Mutual Funds.
Langchain for a bot to talk to customers.
BCG — Consulting — In Chile the career of a software engineers, doesnt exist, you study engineering as a whole and took CS classes. When I graduated a lot of engineers went into consulting. I knew I can code. I worked there for 1 year and I had three different projects, one with Airlines, Paper/Cellulose Company, Mining. Strategy Consulting.
SALARY — $200-250k actual cash, on top of that I have good stock options.
I am senior 1 and senior 2.
Equity —
Probability of it working. I would love to work on a team of 10 people. How clear is the opportunity.
ENGLISH — great
VISA — yes

FELIPE SUOZA — BLIP - SOFTWARE ENGINEERS — BACKEND LEANING
TechStack: .NET, JavaScript, TypeScript, Python, DataBricks, SQLServer, Postgres, MongoDB, Azure, AzurexCLoud, Kubernteres, Docker. + React. Semantic Kernel - to build agents with .NET.
BLIP — I am still a software engineer, even if my current job is confusing even to me. I am software innovation, business innovation developer, it is a beautiful word to say that I am a Senior Software Engineer, but as I am working with innovative methods, to translate business to technology. I am in the team of Blip that is the Innovation Lab — We are working with agents, I started developing an API that is a platform to orchestrate multi-agents, I used .NET, Semantic Kernel it is like a LangChain, competitive langchain for .NET and C#. We don't need LangChain in .NET.
The concept of AI agents I the same, MCP, prompt engineers.

Blip is a big company today that owns a platform to create chatbots, our platform is a no-code platform to create chatbots. My main role is to inspire and create ai agents inside the conversations. This platform brings a new possibility to bring AI agents in the conversation.
Our Agents Platform in in Parallel with Blip — you can make a conversation with this platform that I built.
Integrations with OpenAI inside Azure. I have tested Gemini and Claude.
Before that, I held create payments inside conversations. I helped with payments integrations, for creating e-commerce inside cnversations. Conversational Commerce platform.
SALARY — 12000 reais — $2200 >>> $4-$5k
Relocation — São Paulo

_____

EDUARDO OSORIO — SOFTWARE ENGINEER — FULLSTACK — Front leaning.
TechStack: React, NodeJS, JavaScript, TypeScript, NextJS, Tailwind, Apolloclient, GrapghQL, Redux, Express, NextJS, Apolloserver, MongoDB, SQL, PostgreSQL.
QUBIKA — I have been working for almost 4 years now, a bunch of clients, I worked on an internal project for about 6 months, all the clients have been in the USA.
PETFOLK — https://petfolk.com — The last time I worked with — I helped the build an internal chrome extension
CENTR: https://centr.com - 8 months — Chris Hemsworth' company — they have their backend in .net, and they are migrating it to typescript with NestJS. Before that I worked on 8-10 months, on frontend, they are an app, for training sessions. They wanted to migrate their whole frontend. They had two frontend app, one is the log out experience, they have a single page app. Track their log outs, etc, we were mainly on re-branding and re-designing. Content management system. They had a problem because changing content in their website was difficult. Now the marketing team can upload the content on their CMS. We redesigned their frontend and we created new sign up flows. Redesign the app.
Q-Centrix: https://www.q-centrix.com — it is a company that provides software for clinical data management, collect and analyze clinical data. Angular app that they were migrating to React. I helped them migrate to their new frontend on React, they built a custom component library
VOOKS: https://www.vooks.com — video books for children — animated videos, the features are called Storyteller, they wanted to allow users to record themselves reading their books. By parents and loved ones. Creating an app where you can record it, merge the audio with the video to have a new narrative options.
Before that I worked on Qubika building the internal invoicing and admin platform.
OLIMPICA —
SALARY — $5k starting $5-6 ——
RELOCATION — Open to relocations — if
ENGLISH — 9.5/10
Will send CV.

_____

BOLIVAR ANDRES ROMAN — Backend Engineer
TechStack: Go, Golang, Python, NodeJS, Docker, Kubernetes, AWS.
I have used React very few. I Kushki I used React.
DEUNA — building different integration with current product. Integrating new payment processors like Stripe, depending on what the customer needs and depending what payments they need to process. I have made integrations for clients in the food and airline industry. I know how the conciliation of card transaction process is made and all the workflows to implement it from scratch.
Deuna is using AI to integrate new payment processors and workflows. The workload for developers. Implement AI in your current workflow to deliver integrations faster. LLM use all the data that we have to provide feedback and information, to increase sales, reduce risk of fraud operations and etc.

KUSHKI — I worked with api architecture and design, I worked on apis, POS to read physical cards and read all the messages to process transactions with visa and Mastercard, when you have to build all the messages. Sent by a customer or card holder. I worked using Amazon Glue for making reports and loading data. Products here were the payment processor, payment integrations and POS.
I provide some support to the AI specific team. I am also studying AI stuff. Specially making agents and implementing LLMs to build a bot to provide insights and information for the data that we have. I am mainly focused on main LLMs at first.
SALARY: $3k/month >>> Looking for $ 3.5-$4k

_____

_____
LOST PROFILES

_____
_____
ANDRE BONFATTI
TechStack: Golang, Ruby, Elixir. TypeScript/Angular.
Infra — Kuberntetes, AWS, GCP.
Birdie — 70%React / 30%Golang and Python.
Customer Data — we categorize that, use data to present the client with insights. I work on the team called application, we take care of the website, integrations like Slack and teams. Slack connectors are my child brain here. We basically provide an assistant where people can talk with their customer data, calories, analyze
ChatGPT, LangGraph, Agent Logic, User can interact with data, biggest part of the day.
VITAY — Company was acquired —They had a CTO, just take care of the startup leaving when they sold the company. Me and another more junior dev building. 120 customers, building for healthcare on Canad. Send a link as ex-collegue, information why the company should hire them. Also just for service in general. Referral service to help people in the hiring process. Early stage of the hiring process and pass info about the work style. Rate form 1-5 how this person performs in these different skills and qualities
GYMPASS — I was working on the data pipeline and engineering team, we had a few connectors, we were responsible to have a data lake and have an analytical tool in the data lake. We were growing so fast. The developers program into the backend services. Labelling the data. Cross reference. The data lake was there, I was building pipelines. Segmenting the data lake. Instead of using the rough data into the data lake. Aggregate the data.
Airflow with Spark, S3, we used
NUBANK — KYC process of knowing the customer data, I was responsible to gather all the data from new customers. Get bank account and credit cards. We had some bureaus, we needed to have some controls on our side. So those kind of data exchange,
DogHero— full stack
Movile — full stack
I started my career as a full stack. Startup — myself as a developer, reviewing CVs for small companies. Things didnt work out. Backend. Using Ruby on Rails, being close to product.
SALARY — $42 dollars / hour

_____
ALI HASHMI — INFERENCE ENGINEER
vLLM —
Cuda — not, previously I did a lot of Cuda programming. MultiGPU and distributed training. It is not my day to day work.
BIFOLD — Third party projects, using the engineers, and also the applied scientist. AI Projects for other institutions, it can be ranging from different sectors.

Charite Hospital — https://www.charite.de — One of the projects that I was involeved was to use multimodal foundational model, pathology and imaging. And also doctoral report. App that combines doctoral reports, multimodal, app that is deployed on the hospital. When a patient comes they can take a photo and assign it on the data base. They want to have a score and regular checkup. I developed the whole pipeline, serving the LLMs for the doctors. Because of the kind of device they have is very limited on the CPU and GPU model, even loading in a big server takes time. A lot of efficiency.
Zalando — https://en.zalando.de/?_rfl=de — There was another project involved in agents, and we needed to have small language models, and for that reason we use special tools. Also related to e-commerce, they wanted to have a chatbot. The kind of company that has this app, order clothes, if something happens they want to connect with an agent. Small language models. Use inference.
SALARY — $150k-200k
Also interested in $100k

_____

DANIEL PULIDO __
Techstack: Swift, SwiftUI, UIKit, Combine, Viper, iOS,
LULO — I developed the financial daily on the application. Dashboard of your transactions. I worked on some teams — the credit card, the pockets, I did a lot of things on the pocket flow. When I started in Lulo, in the flow on Flow of BreB
Seguros Sura — I did a lot of things in Saguaros Sura, all my work, helped in the module of insurance of cars — If I am not mistaken they have an app, all the company insurance
I worked with a multiplagorm framework, Samarin and Flutter. Now on Lulo we have a mix of flutter and Swift.
I have a funny story because when I finished my bachelor, I started with some friends. Delivery of alcohol, we had a small group and then started the pandemic, I like startups. When I started in Lulo, Lulo was startup
SALARY — $2k to $3k -$3.5

_____

ABKISHEK PANDIT — INFERENCE ENGINEER
TechStack: Python, GraphRAG, LightRAG, Pydantic AI, Autogen, Langgraph. Agno AI, Vector Retrieval, Colbert, Rerankers, HYDE RAG
Agents, RAG, LangGraph, KnowledgeGrapghs
No inference optimization — public apis
Stealth Startup — GenAI developer — developing solutions and leading teams.
I worked on 4 different projects
INFERENCE ANALYTICS — beginning of 2024 I was still coding by my self.
Tools: knowledge graphs, Ai agents. Langgragph, agno, open agents.
Pharmaceutical — use case, find drugs, for that they would give a query. Find all the drugs in this category. Litigations against the company. Sometimes you could acquire, take a look at the molecules, help them decide whether or not portencially acquire a new drug.
Motorola solutions — They had 30-40k — we built a solution that goes to those contracts, certain value, certain requirement and find all the contacts. Details, take the playbook. Motorola playbook. For a given use case.
UCHICAGO —I moved to move on a project. Initially developing to myself. Internal policy documents. Testing. Other part of the solutions was a revenue cycle agent. What a normal person would do. A pillar to be sent to this. A user approves the document. Valid or not. Used around 1000 users.

_____

SNEHA BANKAR — INFERENCE ENGINEER — 15+ years.
TechStack: Python, Java, Scala, PyTorch, TensorFlow, AWS, ECS, Docker, Lambdas, Spark.
PyTorch, TensorFlow, evaluating which one is good to optimize resources in the hardware. Not doing Cuda level programming. I am leading a team to do inference. Hsoting the models into our own LLM infra. Cost as low as possible for the clients.

Amazon retail — Triton servers — Amazon has its own instances, Nviadia, but we have our hardware. The hardware of the model depends on the model. Some models don't require GPUs.
vLLMm/ SGLang — more low level optimization. There is LM frameworks. Different technologies. Inference.
Triton inference server. PyTorch team. Optimization at those levels.
I am interested but I don't know if I will pass the interview… I can try to interview. If the companies allow me to learn I am interested.
What roles — machine learning infrastructure?
I think the ML world is evolving so fast. How do you optimize serving of the models. I don't have experience with those opportunities. I am confident that I would be able to do those things in vLLM. Lot of machine learning hosting requires cloud infrastructure.
Platform Engineering — people build these different search platforms. Backend engineering. Also freelance.
SALARY — $400k — I am also looking for good enough opportunities. Then $300k is good enough.

SERGIO BUSTOS — SOFTWARE ENGINEER
TechStack: Python, FastAPI,
Tri — freelance — ordenes de renta variable, yo hice la integracion c# con acciones y valores. Integrar Trini, creacionista de usuario, consulta de saldos, toda la integración con Tri — después, full time, integracion de Tri con Calpa (comisionista) en perú, Python. Nuestro Stack: MySQL, Postgres, Redis, Mongo, Golang, Python, fondos multipais , ahora también todo el back del producto de CDTs, con MiBanco de servicios financieros, a nivel de Tri. Acciones Internacionales. Alpaca. Arquitectura de ese nuevo producto.
SALARY — $3400 dólares — $20%-30%. —

RICKSTON PINTO — Inference Engineer
TechStack:
National Transfer Network —
Recently I had a LLM downloaded, open source language models like Llama, I had a GPU ready, I wanted to see what is the way in which I can do local agents. I was working on vLLM with different GPUs, apart from Llama, Mistral,
LLMs production outputs is slow, so I learned how to do Cuda programming and higher frameworks like vLLM for inference. There is a higher level of abstraction. I began learning on how inference. I have been doing this a lot. Domain of inference engineering. Then there is SgLang, one experiment, what are some good methods of inference in serving large language models. I was learning about the transformer architecture on LLMs. With Cuda I was able to notice where a lot of computation is happening again and again. There is a lot of math in transformers. I was able to write Cuda Kernels. That has been an experience in Cuda.
Use case — different — documents, the Penn Department, needed to do a project using ML AI Agents, sending to open ai but instead using API they wanted to use their own hardware for data protection.

LLM based tutoring — a lot of people, instead of sending the data to chatgpt, you can send your data locally, to have your own GPUs at home. Helping students send message to the GPU and get faster responses.
LLM Inference — very recently open ai released a model, ChatGPT, 120 billion parameters, there are a lot of methods in which people want to use this locally. Insraunce want to use it, with a lot of documents. There is a need to do inference faster. Cloud architecture to deploy via vLLM. From the technical perspective, one would be Cuda Kernels. SGLang. Decoding the future response.
Another big thing like Big LLMs. There is a lot of things that have been performed right now on inference engineering.
SALARY — $200k-$300k

_____

BRIAN TORO — Backend Engineer - Full Stack
TechStack: JavaScript, TypeScript, React, NestJS, NodeJS, Express, Go, MySQL, Postgres, MongoDB, DinamoDB, AWS.
UNNAX — Banking as a service product — provider to other companies to help them being a bank, we make the connections and integrations. Instant transfers, direct debits, and banking apps.
TREINTA -- Payment team - made an integration between the payment processor and us, and we made the payment processor at Trinta product. I worked also integrating payment platforms in all latam and usa. Scaling microservices.
I built the POS for restaurants — I helped build this one from scratch. I worked in Treinta in a lot of different places. Most of the code at Treinta was written by me.
When Trainta started they had a monolith and I made the code into microservices. In the backend part I even contributed to the accounting app.
I didnt work too much on the accounting app. I mostly worked with the payments and transfers with the merchants.
KUEPA EDUTECH — educational startup from Bogota — Learning Management System (LMS) for universities — I built the subscription engine for the platform. They have two parts. The educational part. The product that they sell to different universities.
Spain in a digital nomad visa, I moved to Spain because I moved to study. I worked as contractor.
SALARY — $60k/year >>> $70k year to change.
Europe —
ENGLISH — 8.5-9/10

_____

EDIMO LIMA — didnt arrive to interview — ask for CV and schedule

_____

JULIETH URQUIJO — didnt arrive to meeting and anyways she is a bad fit: job hopping**

_____

August 15 +

_____

FEDERICO MARIA VIVIANI — Senior Full Stack — 10+ years with JavaScript and TypeScript.
Senior developer — I can do backend as well.
TechStack: TypeScript, ViewJS, Node, NestJS, — Frontend oriented —
BELVO — ENGINEERING Manager — Fontend — Senior Software Engineer in Frontend and Engineering Manager in the API.
Data aggregation — we develop product for different and we aggregate data from our users, apis, get info from banks. We also have products of front-end to manage the user experience.
Frontend -- we have a product in which we create different features, interface for the users to connect their account, Bancolmbia, we connect with banks like them to bring data. All the front is the user experience to connect data.
eDreams ODIGEO — travel agency — it is one of the largest travel agencies in Europe. They sell travel. They are in charge of managing the prime product. A monthly subscription to have discounts in flights. All the funnel touches the user experience. I was working on the prime product.
Stack: BackboneJS, React.
SALARY: $90k / year + bonuses or equity.
Relocation — 150k
Relocation alone, no family.

_____

GUILLERMO LEON ALVAREZ SALAMANCA — FULL STACK
TechStack: React, Java, Python, SQL, Snowflake, AWS, Scala, Grapahana, DataLog.
Python for data pipelines.

ANGI — homeowners and renovation app — they have bought different companies, AngiList for example. It is a platform for people who provide services for renovation and maintanece for homeowners. If they are subscribed we can provide proposals to them.
They had AngiList and Home Advisor, and the idea was integrating those platforms, into Angi. The idea was migrating all the users from Angilist and home advisor. The idea was understanding the database and working alongside different teams, as comms, sales, invoices, and migrate all that info to the new platform, so the users can enter directly into the main platform. What are the challenges? Mapping info, there are some features that don't exist in some platforms so we had to work with product to see if we need to make a new functionality or not. Build new features when needed. Also the stacks are different. For activating the users is not just passing the info, but there is business logic, like for example suscriptions, understand the microservices to know which endpoints we need to call to activate users. In AngiList was Scala, and Angi is Java. There are people who want to suscribe, the prospects, and clients there are 1.5 million users that were passing from these companies to Angi. This one was building something from scratch because we had to create a framework to build the migration. Before that I worked on another project from scratch to allow people subscribe to the platform without a sales person, I built the online enrollment product.
Here we have a lot of data pipelines for libraries that we have in the company in snowflake, extract the data from the data lake and then create reports. For digital marketing data for example.
FRUBANA — Microserce for the invoices for the curriers and transport companies. It was a a process, an app that runs every night for the 'remissions' of the route and the products that they have to deliver. So their task and the money they get. And data pipeline. Techstack: Java, Scripngwood, React.
BLACKBOARD — I was working with integrations of chatbots, integrating in the LMS, I also built a product to see if the students where doing faking (plagio) where they send the tests or homework and they checked if they did it or not.
Salary — $6k >>>> $7k-8k.
Relocation??? — if there is possible a relocation, or Ai, I would like, 6 months. Would need to move with Wife.
Master in Georgia Tech — the university is well recognized in USA —

_____

KATTYA CUEVAS — FULL STACK RUBY
TechStack: Full Stack (Backend Leaning) — Ruby on Rails — Python and Frontend with React. Postgres, MySQL, SQL server, JavaScript. Geroku. Docker, Kubernetes, AWS (knowledge but not expert). React Native.
BUK — apart from bug fixing, I was in a migration project, they had a news portal, they migrated from a past one to improve the interaction they had, I was looking at the old data. I had to migrate data. I worked on the React Native app — push notifications, log in, authentication. Small fixes.
But stack is Ruby on Rails and JavaScript and React on the frontend. Web app.
SHOPIFY — I was working on two projects, migration of data, they gave me a user data, I was in the installments team — adaptation the data base to do charting, model data in modules and tables. The charting is what they wanted to implement, they do that for having a form of organizing data and data search faster form clients. The installments team and payments team, needed to adapt, they realized that table wouldn't work and that table was shared with other tables, but deleting a table with millions of records takes time, and when deleting it it generated performance issues in the data base. We had to fix it. The library that we were using was made by Shopify and there were mistakes. At the end we solved it. At the technical level we needed that the search of information for different features would need to be faster, for that you need to organize better information. Organizing better the info from clients. It helped all the app, including payments as for the different calculations, for different features they could perform better and scale better with the info, how you save info can free space and get money back.

CLOUDFORECAST — I was hired to remake the app, the frontend. The founders and me, the first task was to redesign the app. I had to talk with clients, I built the redesign. All the features were new. We didnt have the suite
ABLE —
PLATZI —
Salary — $4k but / Shopify $6.5k / 4-5k
Relocation — Remote. I prefer it. But open to relocate.
Pitch or feedback — she doesnt know how to sell herself well in terms of product.

_____
JERRY LUONG didnt attend the interview

_____
ANTONIO MORA RESTREPO — BACKEND / Full Stack RUBY
TechStack: Python, Django, Ruby on Rails, Go, React Native, React. Postgres, Big query, MySQL, Kubernetes, S2, SQS, S3, AWS.
Airflow, powerBI, Tableau, Redshift.
FINTUAL — I have been working 3.5+ years in FIntual. Transactions. I have been working on money projects that enter money and go out of fintual. I developed our most ambitious project which is our Banking Core — before we had to connect with an external bank, get info from the bank if they invested, if the bank failed it was outside of our control. So we had to develop our own Baking Core, that connects with the transaction system of Chile. I developed two apps. In GO and Python. We connect with the Central Bank and certified our banking core. Fintual appears as the list of options of banks you can transfer money to. Test driven development, pair programming, we worked hard. The second part of the project was the integration of the FIntual Bank with the Fintual Platform. That integration took 6 months. IT touched the Core in Django, like the app Fintual in Ruby on Rails. At the end of the day the money should go towards the asset. These flows move 60 million dollars without any human intervention. For clients this is instantaneous. Before it was 4 minutes and now half second. Now it went to production and 80% of clients are using it and I am the owner of the Core Banking. New features.
I was working the first year on the Ops Team of Mutual Funds — accounting of funds, our biggest challenge was that all mutual funds, was making analysis of how is it going, if the fund rented or not. It has inputs from different sources. Our clients. The dollar price. When I entered Fintual, we had 4 people to close the fund. We improved UX and internal ops. Improvements for daily operations, improvements.
MANAGER SOFTWARE — business intelligence and data science — Airflow, powerBI, Tableau, Redshift. It is an ERP for Chile — it focuses on Pymes. It is Cloud Base. I was working o Business Intelligence. I built a data warehouse where all the info of companies could be in a centralized. ETL flows for data from. Managers to feed the data warehouse. Also make reports with Tableau, Dashboard for reporting the CEOs and Managers to take decisions for the company.
SALARY — $4k — I have a plan to go live in LA. My wife will start a PhD in UCLA. I will move on August 31. Chileans, we have Visa h1b1 that we don't need lottery. So it is easier to get sponsored. $150k -$200k — Sponsor Visa — I could work in SF some days.
LangChain — two weeks ago I got one week to play, I built a RAG, I built an agent. Cursor. LangChain knowledge. I had to agents and I could ask questions, questions in human language of how many transfers came in today, consult to SQL, then go to bigquery, and give an answer.

_____
MATTHEW BIRDSALL — Data Engineer —
TechStack: Python, SQL, Java, JavaScript, AWS, GCP,
Consulting and Technical Project Management — I have done pre-sales and post sales engineering in the past.
Our current architecture, Serverless, Data ingestion, Lambda, S3, Athena, Services managed by AWS. Spark.
Snowflake?

I transition from the technical lead and staff engineerfor the data engineering team. I transitioned my role at the beginning of the year. Now I worked on projects that come across engineering. Evangelizing some of the architecture that we already implemented. I code 50-50 of my time.
Service team — I have been doing a lot of text messaging, but just some of the data. The groups is the Core service team, our admin portal reporting, core detail records and calling platform.
I built reporting for our finance account payable and account receivable units.
I work really closely with Snowflake, we did a migration inside sales for Snowflake, I was one of the main programmers on Snowflake. For data bricks I have been on two different implementations for Data Bricks.
SALARY — $210 - 230 + equity - it will come down what the benefit pack is. I would like to work remote with some travel. My current job is in person, so I am co-parenting relationship. It is really hard commute everyday. Fully remote or local.
Remind me of industries — RevOps and Fintech, Legal Tech.

_____

DANIEL ANGEL BARRETO — 12+ years in Full Stack - so so experience
TechStack: React, Rust, Blockchain, Postgres, MOngoDB,
ANGELS — startup that I founded — for applying my skills as a software developer, outsourcing —
MASMA — full stack blockchain developer — It was a blockchain product
SPOZZ CLUB — blockchain dev — I built smart contracts in solidity.

_____

LUCIANA FERRERIA — AI/ML Engineer
TechStack: Python, LangGraph, LangChain, AWS.
Data Preprocessing, LLM applications, Transformers, NLP tools to process test, RAG,
I try to get away from React, I try to be very minimalistic.
when you have to pull a PDF and you have to do some type of processing they have to speak the same language, format, to normalize the usesage of PDFs for your applications.
I was working on
The person who is commissioning to me, tell me what to use, if the person wants Supabase, for example. I build MVPs and proves of concepts but I also have worked with AWS and so on. I am really versatile.
VOZ AI — one of the most recent project I built is a Sales Intelligence, when you have a client in the pipeline, the key account manager, they can record the meeting, upload the recording and the app is transcribing the test, and we are processing this, they can add the website of the company and the LinkedIn, second round of processing of the LLM using some sales tools, so we have literally a roadmap, what are the blockers, who spoke the most, who spoke the list, all calling LLM APIs. — https://makeone.com.br/
BLIP — UX Designer — Conversational AI — this was a job on the books, it is a different kind of jobs, I am an LLC, and I provide software services. For Blip, I had a work, signed. I was a UX Designer for Chatbots. They are mostly ruled based but is easy to attach to
She is kind of confused with her career.

_____

_____

_____

RENAN CAMPOS — SOFTWARE ENGINEER — FULL STACK / Frontend and backend strong.
TechStack: React, React Native, Node, Clojure, Postgres, MongoDB, MySQL, Oracle, DynamoDB, AWS, GCP.
STONE — instant payment technologies PIX, I was enabling our customers to be able to use PIX. Connecting the APIs from the central bank into the product. I helped build the mobile part — Multicard experience.

ARTOH — Receive payments fast from business in Africa — banking as a service, the initial idea changed after I left the company. Provide e/coomerces to have more control of their cashflow, how much, taking the money, anticipate,
NUBANK — Nubank investment app — implementing the whole investment platform end to end. It affected the whole company. I specially built and integrated the KYC product into our investment app. Sign the contracts, ingest more information, a company that can sell and manage the shared in Index Funds, and Nubank deployed this into the Nu Investments. But we also implemented. Money laundering stuff, all the questions to being able to do the investment. My task was understanding that, implementing in a good timeline.
ENGLISH — little bit difficult to understand because of Brazilian strong accent… 7/10.
SALARY — $40 dollars / hour — 6k per month
Relocation — open to relocation

_____

TIAGO MENDONCA — Software Engineer — FULL STACK (backend focused but strong on frontend)
TechStack: React, Node, Go, Python, Kubernetes, Oracle, Lambdas, AWS, GCP
NEOSPACE AI ($18M)— started as a frontend developer then I am working now with containers and AI Training management. We have a cluster where we train our models and we make inferences. We are training LLMs for the banking industry. We currently have 4 kind of products, a CRM, the credit score product to help decide if giving money to someone, Conversational App inside your banking app, Voice AI. I work at the Core of all of them. I provide internal tools and safe environments where they can train the models directly. They don't have access to the machines. I built the DevSpace product, a container for various machines where other devs train and manage the resources like the GPUs. I provide tools for people to work with Cuda. We didnt want to give access to the user straight to the machine. We started creating containers for these users, we started making the experience of training inside these containers better. Because of the product my colleagues are able to train faster. Do distributing training.
I do work a lot with vLLM — because I do have the DevSpace and provide server.
PORTAO 3 (YC S21) — full stack — I was a full stack developer, not so focused on backend. Three jobs. I was the owner of the main product — the first product, the MVP and scale it, it was about company expenses and travels. Book hotel and book fights, and get some money in the credit card. Then I was working on the credit card product for digital marketing, here only backend.
SALARY — $14000 >>> 19000 a year. >>> $65k
Sometimes very slow to talk
English —

_____

JENNIFER RODRIGUES — BACKEND AI CHATBOTS
TechStack: NestJS, Node, JavaScript, TypeScript, Postgres, MySQL, MOngoDB, AWS
Frontend? Not really.
BLIP — Mid level chatbot developer — I do use their own platform to do the development and chatbots, you can use their own platform but also Facebook and instagram, JS .net and C# APIs. Their chatbots use AI but I don't work much on implementing the AI, just consuming. I am working for a couple of clients, Futura Inglesa — English classes and students can ask information about it. They can do an online level to see their current English level. They can see they are beginner and go to beginner, if they are not beginner they consume the client API, chat and know their level of English. Another client is called Recovery, they do settlements of debts for credit cards, they buy that debt and go after the person to pay the debt, they offer discounts.
DASA — NestJS, NOde, JavaScript, TypeScript — they own a lot of hospitals and labs, they have a website where doctors and users can do for online consultations — doctors can do online consultations, do around two years.
I have been taking some certifications, AWS, Microsoft AI 100, and I am taking the AWS Certification, using AI tools in the Cloud.
LangChain and LangGraph

SALARY — $6000 Brazilian reais — $1.5k
Relocation — Open to move to São Paulo — she considers it but good increase.

_____

VICTOR BRITO — Frontend AI Engineer chatbots.
70% frontend / 30% backend — I wouldn't feel motivated, because I like to work with the client facing stuff.
TechStack: React, NextJS, NodeJS, Sigma, Python, .net, C#, GrapghQL, Postgres, MongoDb, Azure.
BLIP — Chatbot Company and Communication Company — I am a full stack dev — in the front react and typescript, in backend with .net, internal no code platform for developing static and ai agent chatbots. Our clients have very specific projects for it. On the AI agents, once they started to raise in the market we have different use cases, we have chatbots, we have a partnerships with a big car company, when the clients buy the cars they are greeted by the AI agents, and they answer it. I developed an AI agent totally integrated in the frontend, like an automation. The agent tracks all the time the users, what to see, what to use, the other times the client acess it to give instructions and what to do.
I am more of a frontend guy, I do simple integration with google and open ai apis, I didnt get deep into the ai stuff.
PwC — financial consultant company — I worked on the IT area, analyzing the clients IT infra that were relevant for the security of the financial aspects. Management of changes, segragation of roles in the development team. I was a consultant in the more technical part, for bringing it strategies for security and financial it.
KUMULUS — Python and Selenium to do automation, I built with PyTorch, AWS Lambda, React and Node, I was really passionate with Frontend and JavaScript. — I worked with different products because it was a consultancy and IT, I worked on a project, integrations, QR code for an industry company. I also worked with integrations of payment methods. SKF. - https://www.skf.com/br - I worked on the payment side of the website with the subscription product, also integrations. Frontend developer.
Salary — $3.5 dollars / month >> I would like to go around 25% increase
English — good

_____

SANTIAGO RODRIGUEZ — 6+ years Software Engineer — AI Full Stack LangGraph
TechStack: React, NextJS, TypeScript, Rybu on Rails, Java, Node, Python, Flask, LangGraph.
LangGraph (8 meses)
EXANTE — Convert customer contracts into cash faster with ai driven automation — AI for invoicing (cobranza and invoicing) account receivable and collections — automating the CFO office — NextJS.
I am more focused now on the backend structuring agents. Backend in Python, it is my first time building on Python. I have worked a lot of microservices. I am working with LangGraph, it has a learning curve, it was difficult in the beginning, now we are doing Evalvs and the UI, it has been working well recently.
We build on atomic design with the frontend, guidelines. Then I jumped into backend for agents. I have been 3-4 months only receiving the frontend but mostly working on backend.
Front of how to put the agent.
AI Agents for Finance
SKILLSHARE — full stack —monolith on PHP also some part go frontend, frontend on NextJS — I was on the Teachers Team — building teacher tools — the last project, how to launch a class module, index the classes in a new way, new tabs, new ways of submitting content, the creating a class flow. Making a search module for 1:1 sessions, for this we used Argolia for searches. GraphQL.
BUNNY STUDIO — Full Stack — I was learing, I was making the search engine, I helped built the new website. We were migrating from React to Next, and I made the search engine frontend in React and Next.
SALARY — $120k

What I want — The team where I am lacks seniority, I want to work on an AI team, teams that are implementing AI
Why healthcare — It is one of the most complex systems and most bureaucratic, and AI can get data without structure and structure, I like the impact. The problem of healthcare is that is very corrupt and very slow. I like to break things.

_____

ISIDORA SOFIA VIZCAYA
TechStack:
UBER — Backend Engineer — Solang + Java — Depending on the Product where I am working. Checkout experience — Uber Eats, since the user create a shopping cart until confirms the order. It is a critical part of the Uber Eats platform. Now I am in a new team, The Growth Team — user from Uber Rides to Uber Eats. Convert the people from Uber Rides to Uber Eats to make orders, here I am working on Java. For example my last project, was as a Growth Team, target of users that havent make an oder, we build features in the Home Screen, where a new component appears with promotions of different shops, so from the Home Screen of Rides they can see the promotion of Uber Eats to make the first order. I habilitated this carousel in 29 countries. In USA, Canada, etc,
FINTUAL — 5th Engineer —from 5 to 150 engineers — I was working as a Full Stack — Ruby on Rails and ViewJS / React — I was two years as a Full Stack, I built a fund profit comparison, we check th e invetment in other entities, and we show them analytics of ROI in different funds. Now it allows to users in a click make an request to move funds —
I was the Manager of Operations —
Accounting System for the Managing of Investment Fund —
Banking Core and Debit Card — the development of the baking core — I helped build banking core. Here I worked with a different tech stack, we started in a service apart from Fintual. Some of it in Ruby and some of it in Go. I had to do the configuration of AWS for deploying our service. Initially Fintual when it was small the Cloud was on Heroku and then Fintual moved to AWS. And in this project I made the deployment of AWS for the Core Banking to integrate ourselves with the Central Bank.
U Catolica de Chile - Teacher at U Catolica
SALARY — 100 millones de pesos anuales brutos — $100k with stocks and benefits.
Relocations — I need eventually to move, my husband will move to the USA. Main universities are in SF.
I use AI / Cursor // always trying new tools, Claude code, and so on

_____

RYAN YIN — REINFORMCEMENT LEARNING ENGINEER — Inference a bit\

TechStack: Python, Go, C++, Golang, Java,
SGLAng — I am heavy focus on changing SGLang Repo,
Also worked with ByteDance framework
Thsingua university
I don’t think that I have more experience of using it, and integrating it, I am not that deep on inference itself. I would be interested.
Cuda — I know how to use Cuda —
Most of my work is implementing SGLANg into RL projects.
About 70% of RL workflows.
A lot of space to optimize. I am working on optimizing the speed. Very heavy long tail problems, related to me and my team, for dynamic sampling. More effectively. Also after training we need to update the ways from training to inference engine.
SGLang project — I am interested in AI Infra, and I saw that the community is very active.
Work Full time — I have time — from now until December — 10-20 hours / week
Salary Expectation — $150-160k
Is it a startup — depends on the situation

_____

Didnt attend

JINME MIRABAL —
TechStack: React, View, Python, NodeJS, Go, AWS
WHISKER — Pet Robots Company — we create Robots to feed pets, we try to create the best experience in the industry. It is the biggest company in this sector. We create robots, we have an app to control this machines, to understand the behavior of different pets and cats. At the end we try to keep near.
Backend — I am a product engineer working with Cloud services, AWS, DinamoDB, Python, NodeJS. I migrated all the backend from NodeJS to Python. The story is mostly about the cost, the cost was increasing every year, every time we scale, as well as the performance, Python works great with AWS and Grapgh QL. We increased around 30% of the performance.
Our project is related to the app. We construct the API that relates to pets, users, robots. I am part of the Core App. All the information, we are working with Serverless.
PLATZI -- I was working as an engineer manager, because I have a lot of experience working with big teams, I managed different teams across different fucntinalities. My main thing was related to the Business Part of Platzi. The Business part, selling courses to Companies. NodeJS, Python, React. We started with this part, my main goal was creating the best product for business partners, we increased the customer engagement for 20%+. The most important was to keep the team balanced.
Coding — in some cases I was coding, not a lot. Even we have a tech lead, but it was not necessary. My priority task was more related to manage different.
RAPPI — In every job is understanding he product. In Rappi it was a rollercoaster, my experience in Rappi was my first experience in a big startup. I started as a Senior Backend Developer. We created the experience for big companies, like Addidas, Exito, etc, to how to create the inventory, the checkout, everything.
We created the API side and we constructed the different. It was possible to customize the experience to the different clients with the same tool. Developed the Big Partners Tool.
Techstack: MySQL, AWS, NodeJS, Python, Golang,
English — pretty good 9/10
SALARY — $5k / month. I feel comfortable in that way. With that salary, depending on the responsibility. Right now, I want to change the job as I am working on a project as a Data Engineer. I prefer to work as a Backend, Full Stack with React or View
Relocation —

SEBASTIAN MORA CARMONA — AI FULL STACK — 50-50 more backend heavy
TechStack: Python, Django, Node, JavaScript, Express, React, View, PyTest, S3, Cloudfront, Jenkins, CI/CDAWS.
DAILY BOT (YC S21) — since I joined they had a traditional chatbot, we started to implement GenAI, I implemented different models, RAGs, Embeddings, we released a product from two months ago. An Agent product that is using LangChain, LangGraph, the traditional chatbot, LangGraph and Langchain, different tools that the agent can choose, embeddings to get all the client info, get info from a RAG. We implemented all MCP tools, we are working with an NCP server that is working with LangChain.
We are mostly doing this for a Chatbot — we released a new product called Esintro — that is an agent, for Slack, Microsoft teams, DailyBot has a lot of information of users, and it was really hard to get insights from these information, we passed two embeddings, if a manager wants to query what happened with an employee or with a developer. Ask info from VectorDB. Get a chart, send kudos (congrats), many things can happen
US Market — Nintendo / Rakuten / there are a lot of companies, there is big companies that use DailyBot — I
BENKY — I was working on a crypto project, decentralized fintech, we had the opportunity to build a wallet, have Crypto in your wallet, we created a payment flow, you were able to arrive to a shop. A

shop that you have in your town and with that QR, you were able to pay with crypto, the owner of the shop would receive COP fiat money. We had the transaction internally. Express, React, Solana, AWS.
SALARY — $2300 >>> looking for $5k
Next:
Relocation - if I have the opportunity to be relocated.
I live in Colombia but I was born in Spain. Spanish Citizen and Colombian.

CHANGYI YANG — INFERENCE ENGINEER
TechStack:
SGLang project — my optimization for SgLang is for reinforcement learning. Long tail request issues. Daily work. IF you want to know how much I do on Inference. I also have some experience,, I worked with some Kernel engineers to reduce the cost and time. I mostly do Reinforcement Learning. We are about 10 people supporting different frameworks.
Cuda — I do have some Cuda experience, mostly is I can read the Kurnel and understand it, and read different Kurnel structure, but not contributed.
Yes it is pretty much related to me, for different scenarios, we have different optimization techniques. That experience can overlap. Optimization in different hardware. That is also my future directions.
vLLM — I would say I have some experience with it, but not as much as SGLang. Most frameworks, to understand those frameworks I need
Inference optimization examples — I can talk about a project that I was working on. Previosly, they used agent mode. Previosly, engine, calling is instance, for some problems, we would compute with several resources, we need to gather all the data to the GPU RAG, you can see how these requirements, to take into one, this gather and exploit process. Some problem and .. while you gather this… one GPU, RAG. I take that to a server, …….. (((would need him to explain this, on a written note))))) Reduced it.
Another, good point is that we connect SgLang, we can
SALARY — $140k+ and for larger $180k
Starting part time before graduation date —

TIAGO RAHAL AIRES — 75% full stack and 25% automation (more recent)
TechStack:
CREFAZ — Automation — Web Sraping. One Script for Internal Process for Spreadsheets. I need to divide that, the files. It is me alone at the company doing automations. At a financial company.
Also Scraping on external pages to check info from government and expleoyees. A lot of Playwright and Selenium. Python that allows you to manipulate the mouse. PyAutoGuide. The last two years I started working with Python and Web Scraping.
Here in Brazil most of info from companies are in public access, the real name, etc. Public access and the credit company, sometimes they check some companies. I was checking it, part of the job, this is too slow, the info is public, I was trying to make my own API. It is not related to the company. I was just mad about
Baires Dev — Ruby on Rails Apis. Rental something. (((Not so much product oriented)))
PLATHANUS TECH — I did a script to download and transform Postgres data base. Basically, 5 gigabytes. Postgres. Created an API>
SALARY — $1300 —>> 1.5k and 2k.

RAFAEL PEREZ — BACKEND ENGINEER RUBY / FULL STACK + front and cloud
WHY THIS CANDIDATE __ SO UCH JOB HOPPING
TechStack: NextJS, React, Ruby, Ruby on Rails, Python, JavaScript, Elixir,
Ruby and JavaScript, TypeScript, Postgres, MySQL, Redis, Kafka, AWS.

Lightnishware — WebRPC, video calls, the protocol for video calls in the web and in browser. I was supporting the video call product. I was working with that in Elixir. I also worked with Ruby.
https://thundr.com
I was the Head of Engineering — so I was building mostly the moderation system and solving the matching algorithms and react development. It was already built. I contributed the integrations with the moderation system and Elixit Code.
PAGERDUTY — Core Platform for AI Ops— I was working on the monolith core platform, I was doing the Ruby on Rails monolith. Other teams . Handle all the incident management platform of Pager Duty. Creating microservices, handling contacts, creating other notifications. Mostly Ruby on Rails.
POTLOC — full stack engineer — React and TypeScript. Ruby on Rails. The product was related to questioning for people from social media that would answer questions about brands. Fulter and do performance, and include the speed of the dashboard and the way in was consumigndata.
AGENDA PRO (YC W21) authentication microservices. Onnthe company. Ruby on Rails, and react native for the mobile app. NodeJS for some microservices. I was an individual contributor for other parts. I was working with a NodeJS Lambda, anETL from the data lake. Pull information, for churns reports. The main platform was a monolith in Ruby on Rails. The React side was most for the frontend team and I was mostly on backend. Integrating with Tax services to calculate invoices and worked on the DevOps team. I was more of an architect.
Before — Groupon.
Job Hopping — my ex wife is a diplomat. I was also a diplomat so I had to move between Chile, MX and US.
ENGLISH — 9/10
SALARY — $7.2k/month
WHy JOB HOPPING?
Relocation:

———————————

JOSE MANUEL ESPIZONA AGUIRRE — TOP STARRTUP ENGINEER — FULLSTACK but more Backend comfortable.
TechStack: JavaScript, TypeScript, React, Java, Docker, Postgres, AWS,
Also, Python, FastAPI, GCP.
ZENPLI — KYB/KYC — experiments with Python and LangChain/LangGrapgh — running small experiments. In Zenpli we use most of the google stuff, so we use Gemini. We integrate with Gemini API for operation part. Vertex studio — we are using LangGraph for a proof of concept — we have our own infrastructure, prompting, langgrapgh helps me. We want to add this capacity to change between vendors.
One day we were running a demo for a client and Gemini was terrible, so we switch, if the Gemini is down.
Use Case — KYB — for document processing and we connect that with verification layers, you need to, validate if that company is not in a sanction list. Compliance,. We use AI for that analysis.
Backend side Java, Python and GOlang, and AWS and GCP and Postgres for KYC/KYB. NextJS for Frontend.
FRUBANA — I was in charge of the Warehouse area. Tech lead and thennthe head of eng. Inventory, Stocks, Returns, and truck operations data, all related to warehouse. I had a team of 20 engineers. Java
ADDI — I was working on different parts. Working on Financial Core — the price that process all the loan and payments, calculate if you are overdue or not, the interest, all financial calculation. Process all the payments. Installments. Java
RAPPI — Restaurants Integration s— you create an order in Rappi and I send the order to the restaurant system. Started as PHP, and then JavaScript, Python, Kotlin.
SALARY — $7k/month + bonus $3k. Salary is ok, I would like 8k. My main driver is a problem to solve.

Relocation — would you move? Yes if the right opportunity — it would be a good opportunity — me my wife and twins.
MOTIVATION — high!!

———————————

PATRICIO ALEJANDRO TAPIA UGALDE — TOP FOR RIDEPANDA RUBY
TEchstack: React, Ruby on Rails,
React tickets pequeños, siemote he sido mas ligado al backend pero entiendo. Ahora mismo estoy aprendiendo mas de frontend. Mi idea es moverme a ser full stack. Le estoy metiendo duro al frontend.
GLOBANT — I keep working in GLobant. Autodesk is a client of GLobant. I have been 4 years with the same client.
AUTODESK — I have been 4 years working with them. I work on the BIM360 app — maintain the app, my main contribution is preparing this for selling it to the government of the US, we went through auditory, for working with US Government. I was in charge of building this, frontend in React and Backend in Ruby on Rails. I built a monitoring engine, and optimizing queries. Most is maintaining and optimizing, and security stuff for compliance. Ugh scalable plafrotm, making it highly scalable.
AGENDAPRO (YC W21) — Backend — Startup Chilena de scheduling — main software for beauty salons — I built the suite of testing for quality of the product. It was growing very fast and I built good development practices.
I was helping built the first iterations of the product, I built payment engines and integrations, I built the checkout with payU and the dashboard for clients of the schedules and payments, the control panel for clients. Then he moved to the testing suite.
SALARY — $3000 dollars — I would go got $3k-$4k I wouldn't go for less than $3k.
RELOCATION —

——

BRUNO RODRIGUEZ — FULL STACK TYPESCRIPT REACT RUBY in SF
TechStack: React Native, Ruby on Rails, Django, NestJS, NodeJS, TypeScript, Supabase, Postgres, MongoDB, AWS.
I prefer things on TypeScript and Ruby. I am better at TypeScript than Ruby
STEALTH STARTUP — they don't have PMF — Real Estate, an app for realtors — It mixes a couple of products — one of the founders is a real estate agent. Full Stack — I'm doing a bit of everything, creating services, image generation, a little bit with geographical information.
GIS Geographic Information Systems — because there is people who their careers is being specialized in these systems.
FINTUAL — Full Stack — more inclined on the mobile side with React Native, my girlfriend lives in the US so I was searching a job in SF. I was doing mostly full time. As a financial service, most of the most complex things was handled by another team.
I was part of the Mexico team, onboarding and recurrence, how recurrent are the users. Trying to analyze how to improve the usage of the app. Recurrence team, reducing the churn. I did a lot of refactoring, moving many screens, to the new architecture, the main difference, strongly tied to handle errors, and also had another kind of way other make queries and handle errors and project structure in general and improving the app overall. I spent a lot of work on the onboarding experience, being able to assess the risk adversity of a user, are they able to risk a lot of money in the investments? You cannot give counsel to somebody if you don't ask these questions. The logic for asking these questions. How are we gonna handle users with different paths of answers and things like that.
30-40% in Ruby. 60% React Native. Most of the features required frontend more than backend.
CARDDA (YC W22) — Internship — 3 months — I integrated with bank APIs, accounting systems, where I would log, every entry of money. They provide credit card for companies. Ruby + Svelte.

SALARY — $160k+ below that it wouldn't make much change for me. Not a reason to change. Maybe below if they are more stable.
RELOCATION — he is in San Francisco — the company right now is processing my visa and I would be getting it in September. Chileans don't need the visa H1B1. There is a link in my resumes. You can get a very nice Visa. Would need to file another request of visa. They would need to file an LCA, we want to hire this guy and I would need that with the job offer to continue on our side.
Something could happen.
ENGLISH 9.5/10

MAURICIO GIACOMINI — SOFTWARE ENGINEER — BACKEND AND ARCHITECTURE / NO frontend — ELIXIR ENGINEER
Elixir engineer from 2017. ELIXIT Expert.

TechStack: Elixir, Go, NodeJS,
Elixir, React, Next.js, Node.js, Postgresql, AWS, GCP, Kubernetes, Rabbitmq, microservices
I am ok with React but not so good or don't like frontend much.
Stone — microservices architecture — most is in Elixir and migrating to Go Services. — I work card banking team, my team is processing payments from PIX, Boleto, and every kind of payments that needs process from other banks and put it into my account, we have a legacy monolith, we are extracting functionality. Monolith, creating new services. I use in my previous jobs this knowledge of getting functionality, move it to another services. Now I work with the .. Our customers can generate advice, we build APIs and generate invoice, because we send for someone to pay, when someone pays we receive this, we process this, do many checks, basically we are in charge of processing this payment. It is basically this. There are other teams that build that allows customers to pay. Our process in more like Stripe inside stone. Payment API products. Internally but I am also working on the payment API product. I started working on the POS products and payment processing internal product but now we are trying to sell this to companies.
Academy — it was more time managing than coding. I was building a platform like Udemy for BRazil to teach coding.
CREDITAS - - Led the Bcredi team and successfully integrated the Bcredi platform into Creditas after the acquisition. I twas a mortgage product.
BCREDI — there I was building a mortgage platform.
Ruby on Rails — I was very good with Ruby but I don't code in Ruby for 4-5 years.
SALARY — $25000 reais — 4.6k dollars
English is like 6-7/10 he can communicate but a bit difficult.

XAVIER DE GARAY — PYTHON , Ruby , React — FULL STACK —
TechStack: Python, Ruby on Rails, React, NodeJS, Postgres, MongoDb, AWS.
A Senior engineer is not working every time on data bases
GUSTO — Partnerships Team — MCP server of the company, an API for Agents, for other companies to make use of the Gusto Capacities from AI. I am also working on my team with the direct api access, to provide developer communuty to build their own solutions in our platform. Before that I was making connections with large partners, I was on the embedded team. Working with Chase bank, I was developing the API for larger banks to offer payroll services. Payroll embedding API. 80% back 20% frontend.
Ruby on Rails with React.
I build the API for the agents — it is for controlling Gusto, it is a protocol. Instead of a json, you provide results in English in natural language to consume this info. I have worked with Pedantic AI and Llama Index.
SOFIA — Founding Team — I was one of the first engineers, head of payments and invoices. I was working on the payments, insurance and invoices team. I was on engineering and product. Built the insurance backend Core.

Django/ Python and React Native
100% backend.
VIA.work (Justworks) — it started as a recruiting platform. It was a startup for job experiences. Attract top talent who wanted jobs to live in other latitudes, for example in great companies around the world, places in Asia, Europe and so on. Getting out of the MBA to work in a different part of the world. Here I built their whole platform. I was the first employee and first engineer. I built the ATS - application tacking System - I built it from scratch, ours was very focused on recruiting international talent. Not remote, but focused on international matches.
More front-end — 70% frontend React / 30% Laravel with PHP
VANBAM — I was an entrepreneur, I had a transportation app like Uber for work, people who were going to work, use their routes to take people to nearby companies from their neighborhoods. It was a real time platform.
Magento / PHP / and frontend in AngularJS
Before that many platforms from zero, I worked on the largest mining company, did an mba.
Personal project in Pedantic AI —
SALARY — $10k/month // 120k/montly
RELOCATION — it wouldn't be my first option.

_____

FABIAN RODRIGO — SOFTWARE ENGINEER — FULL STACK / BACKEND ORIENTED
TypeScript, Node, Golang, Java,
5+ years with NodeTypeScript.
TechStack: Java, Golang, TypeScript, Node, Python. NextJS and React for Front. iOS also.
MERCADO LIBRE — I am on the search engine — building features, improvement, times of response. I was developing a program with AI that identifies the images and products, and identify that the person who who they say they are. Also working on how to identify the character. Help identify which images of products are the same of the name of the product because many times sellers make mistakes when they upload products.
Performance — what process can run in parallel,
Working in Frontend —list of main brand and the list of brands of one company. Toys and Babies, Cosmetics, Home and Industry, Construction Materials — I work building modifications, interventions, features to choose the kind fo product, color and so on that you want to choose. I built functionalities that shoot this logic where merchants can add modifications to products.
MUNDI — fintech for exporting companies / factoring — client acquisition and invoice advance — Since a sales person talks in the phone, the survey for client acquisition, they need to send the documentation of their company, financially, for logging themselves in the tax system and financial data to score them and underwrite them. KYC/KYB Team. I was working making the surveys of KYC. Microservices.
TypeScript, NodeJSMolecular, React, NextJS. — full stack.
Mundi.io — I was working on their website, I was the leader of a team. I stopped having the acquisition team and started working on the transportation insurance - cargo insurance product and I built this flow.
I built an integrations with Berkeley insurance company and other insurance companies.
RAPPI — Stock Warehouse Inventory Platform —our mission was putting info of stocks in the data base of Rappi to show the stock. I proposed an idea, make a process that detects which products are not in the data base and make an alert for a person to put them on the data base. There were products that we didnt have in the data base. So what we did was making an automatic system to detect new products for inventory managers to add them on the data base.
Carlos Cristensen was the VP of technology and he left Mundi and then he recruited me for Mundi.
Stack: Golang,
Before that I was working on software factories.

SALARY — $4.5 million pesos — $3.3k - 4k >>> $5k dollars because right now the issue is because at the end of the month I have two children, school and rent, too many expenses, so I don't have earnings so I can save.
I am expecting more and less
Relocation —
English — 9/10 — I practice it only reading it. Not yet many technical interviews in English. When I got fired from Mundi I started doing interviews. I think that I will be good to work in English everydayt.

ESTEBAN SALDARRIAGA — RUBY FULL STACK
TechStack: Ruby, RUby on Rails, Postgres, MySQL, MongoDB, DinamoDB, Redis, React, TypeScript, NodeJS, Docker, AWS.
ForUsAll — startup that has a Modern 401(k) plans platform — my main focus is we have legacy apps that are a mess. They are really bad written, they cannot scale, when I joined the company I got assigned. Doing a feature in this project which is spaghetti code will take one month. We decided that the best option was to create a new app, we are migrating all legacy code, into a new app in Ruby on Rails. Intregrations with the walltet and payroll, data ingestion, and authentication.
Skydropx — Skydropx — Decentralized logistics and delivery platform. Currier services. I was in charge of doing some features. It wasn't a thing specific but I was working on identifying and creating security flows for our systems. I was building the KYC service. I was working a lot with APIs and endpoints. In this kind of business we have a wizard that is a form where you create,,.. we have an app built on NestJS, I was creating the order Wizard, the form in which you create shipments. Shipments are the main part of the logistics business. Endpoints to calculate the way of the packages. Get to the places, cities, regions, all the connections of that. Frontend with NextJS and React. I also worked with Shopify connecting and integrating stores and receiveing payments.
Ayenda — Rates Teams / Pricing Engine — in this business rates or prices are very important, the prices is very important and they are really dynamic, I was in charge of the algorithms of pricing how they work. Specifically about how the prices are calculated. We had a couple of challenges. It was huge, we had a lot of prices and a lot of rates were, we had 300 million records of prices. It was very dynamic, we created a lot of prices, that came with a lot of challenges as well as we had a lot of data. One of my resposabilities was also creating a learning culture, so I was running a reading club within me and my engineers, reading a couple of chapters of a book and one of my main responsibilities was developing the career of engineers.
ENGLISH — we have meeting in English, people from the companies. 9/10
SALARY: 6- $7k >>> negotiation.

CARLOS GRISALES — FULL STACK
TechStack: JavaScript/TypeScript, React, ViewJS, NodeJS, Flutter. SQL, Postgres, MongoDB, Se, EC2, Lambdas, AWS.
1DOC3 — I implement full stack solutions to interact with the medical team. Syntopmts and doctors propose medical consuolting. I have been developing frontend features using Frontend. We provide several products, the chat using NodeJS on the backend. We also implement Firebase for Realtime communication. We use Firebase to transfer data. We process those info in the backend using NodeJS. Implementing SQl for info. We also provide other products like programs, important content for eating or sleeping habits, lectures, podcasts, webinars, we developed these using Flutter on the Appa nd NodeJS on the web. Daily I work with all those technologies but I focus more with Flutter. The frontend of the web is ViewJS.
AI stuff — currently we are implementing AI agents in our platform, streamline solving queries for legal and financial assistant. Basically I f the users needs any assistant in those fields. We decided to move to other fields like financial and legal assistants and veterinary assistants. We becoming into a chatbot specialized. We have our medical team to assist with medical assistants but also we are trying to do financial and legal assistants. I was part of developing these ai agents. We developed the model implementing NodeJS, and we have anintegrations with OpenAI APIs.

I am involved in a project based by Pragma and Bancolombia with Springwood, Docker, Kubernetes, Inventory and Sales Management System. Project based course.
Tuya — Intership — I switched to javascript with NodeJS, I developed a project based feature implementingg NOdeJS and React. We were doing an implementation where I had to retrieve the info of clients from the data base, their info of payments, if the system detect that this was a potential client I sent a notification using SMS to capture new clients, so it was a notification system. Let's say you got a credit approved and send a notification.
SALARY — $5 million pesos, I am open to discuss further opportunities and compensation.

_____

MATH FIGUEIREDO — DATA ENGINEER / AI Engineer
TechStack: DataBricks, Python, SQL, Spark, Airflow, Terraform, AWS, Azure and GCP (more AWS expert). Langchanin and Langraph. Llama Index. I have built some RAGs pipelines and now the two main agents is the Transcribe agents and
FACTORED — I am building a Data Bricks Agent — This company is kind of a marketplace for clients to connect with advisors, anyone, and we have a data base of advisors and you ask a conversation with that advisor. The company is trying to break into the field of real time transcriptions and translation for meeting platgforms. I am building the transcriptions agent and the data bricks agent. We cannot hire so much people so we are trying to use AI to do DataBricks jobs and engineer review it.
I am building agents and working with LLM and working with transcriptions models, I am leading a project, an agent, to keep memory, transcribe and have conversations around that. My better skill is with aMIcrosoft Azure and DataBricks, MLOPs and LLMOps.
ALLOS — Leading Architect, they look for me because they needed someone to do a migration from Microsoft to google cloud. I was hired for this. It was a complete success with the design and implementations, we could decrease the cost for more than 90% of the data structure, I also work with optimizations. They were not using the best for data engineering. Desing and Implement a Data Pipeline and Migrations to GCP using DataBricks and Airflow. Allows is a holding of shopping malls, and at the time they were trying to digitalize all for get that data, every kind of data in a mall, why people are entering the mall, where they enter, which shos they go, what shops. Parking data, shoppers data, camera data.
iFOOD — Data Engineer — 60 million orders every month — we worked with data from drivers, restaurants, customers, orders, menus. I was on the New Ventures team, it is a white paper to create new products for iFood. I needed to lead integrations with smaller companies they bought. Azure to Google Cloud was the most impactful. We are impacting 200 million customers.

SALARY — $130k >>> $180k
ENGLISH —

_____

LUIS FERNANDO ROSERO ASCUNTAR — PYTHON ENGINEER / Software Architect.
TechStack: Python, Flask, RestAPIs, Machine Learning Service, Textract, S3, Lambdas, CouldWath, AWS,
Textract — extract text from PDFs from photography, scanning documents. Nowdays company need to do data analysis with these texts, there are a lot of bank account files that need to be analyzed. For that I use Python.
I have used Python with Falsk to research databases and connect between backend and frontend.
CAPGEMINI — A company in Mexico working with a lot of files, in the insurance industry, a company from insurance, this insurance the people needs to have the credentials, the ID, database, for that we take that picture that the user send us and we need to extract the text in these files. We extract to analyze these data from people that apply to any type of insurance.
INTEGRA IT — Odoo framework, a framework based in Python, most of the code in this Odoo program is made in Python. So in this company I had to develop some features for one app that

already existed in the company, to improve the app. The app is a frontend and backend app, and sometimes the client neeeds to improve the frontend. User could do the ID number.
NOT A FIT — VERY CORPORATE.
ENGLISH — $10 million pesos per month. I am looking for 14 million. I would like to continue working on software architect. The path of my career would be on software raising.

_____

DANIEL FERNANDO MENDOZA —
TechStack: Go, Python, Django, Flask, Sanic, Rust. MySQL, Postgres, MongoDB, DynamoDB, Redis, Elastic Search, Apache Solr, AWS, GCP.
MEDIALAB — it has three to five projects — https://worldstarhiphop.com/videos/ — I work on this one, I am in charge of the infrastructure, adding features, and taking care of microservices. I support the legacy infra. Encoding that is the part uploading the videos that are being added there. Search as you type features. It has 10 users per second which is not too much but there is a couple of challenged for encoding of the videos.
MERCADO LIBRE — I was in the asset management department in Mercado Pago — it is basically an account where you put your money in your account and you get some interests. Only available in Brazil and Argentina. I was in charge of improving the latency, having features in the data, using DynamoDB, it was a better approach. The problem was that we were having high latency times when processing the economic interests from the users. Processing that is heavily to the data base and the table saving that info is having millions of raws so the process was taking so long time. Solved implementing DynamoDB
COMMURE — Merlin was acquired, so it was in the transition time, during these time I was in charge of writing Rust Core for the HL& and FHIR standard. It is a standard api for the healthcare communication, the way that you process medical data in services. The API was written in Rust. It provided services for different hospital and clinics, and the main API service was by Commure by different clients, the standard is the same, for the data base was a standard. The clinic hospitals and these kind.
MERLIN — It was basically a recruiting company, it was in charge of moving some services from java to go, I was supporting and fixing bugs in the java services to GCP. New infra, new services used in Go, employers with candidates. Employees wanted to hire people posting blue collar jobs. I was supporting the backend of the app. I was supporitng all the stuff that would show up to the candidates. Merlin had two parts, the employer and candidate part. Showing jobs, scheduling interviews, info from the candidate., the chat.
SALARY — $6k - $6.5
ENGLISH — great

_____

EDERSON FAJARDO LOZANO — FULL STACK RUBY
TechStack: React, Angular, Ruby on on Rails, NodeJS, Python,
React 1+ year, and now more Angular,
LYNXLABS — Coding Factory — digital Wallet and API getaway for payment transactions, the focus is the e-commerce, for this reason I have one product. https://lynx-pay.com — this ie the project I am working on. Payment APIs. This API. Payment transactions and apis.
HOY TRABAJAS (YC W22) — search talent for companies, the mission is searching the talents — my role was a Ruby on Rails dev and fulll stack, React components, data base, unit test, supporting the internal client. I was building the platform for searching talent. Enterprise / Company app. I was building the admin app for the companies. I was building a CRM and com integrations too. In this Api we created fuctions for communication mostly with WhatsApp.
MOnokera — started his career as a
ENGLISH 6/10 - very difficult to communicate,
Salary — $2k now.

_____

TOMAS HERRERA — FULL STACK RUBY REACT

TechStack: React, React Native, Flutter, Ruby on Rails, Postgres, MySQL, DynamoDB, AWS.
ADMIOS — It is a bank — they have a product of the bank and that is a startup, it is a specific product for loans on people that want to have plastic surgery. People who cannot afford plastic surgeries can apply to a loan. Plastic surgery. React on the front and Ruby on the backend. Webapp. Senior software engineer. I have built everything from scratch, I built the payment gateway, a module that generates payments and send reports. I integrate with Stripe. — https://goalphaeon.com — mostly secretaries and assisntats are the ones that handle it.
VERY — agency — they do mobile development, here I started working with React Native. Work on the projects, they switched to an IoT company. I worked three years on React Native. A smart fish tank, a hardware that controls the temperature and lights. Smart Tank — https://www.youtube.com/watch?v=HNakYOjWD_c
QRVEY — Embedded Analytics for SaaS — it is a Survey app, the clients that are large corporations would send surveys to employees to get their statistics. Collect, Analyze and Automate. I was working on Collect and Analyze. Mostly NodeJS but also Ruby. Collect is how they collect the information, allows the clients to design the services, we used DynamoDB because every record can be customizable. I built the frontend and back for these customizable surveys. Building Customized Surveys, and also analyzing the data, then also frontend of dashboards to present info.
BAIRESDEV —
KOMBEA —
SALARY — Save Up — Rewards Company — Agency, I was a junior developer, it was basically a mobile app. Add credit cards, show merchants, get points and get cash backs. It came from healthy people wanting to save money. People have so much credits cards and they. I was building everything gor them. as a full stack.
https://www.google.com/url?sa=j&url=https%3A%2F%2Fapps.apple.com%2Ftr%2Fapp%2Fsave-up-budget-money%2Fid1626893854&uct=1747867631&usg=z_X8IYNh8iKb5eWxKtxfWH7KwTY.&opi=76390225&source=meet
SALARY — $4500 — I like to take into account benefits and those. They pay me through deal.

I like being a good fit, when the stack is similar to what I do. I want to have freedom in decisions.
Payments — PayPal and Stripe.
ENGLISH: 9/10

———————————

———————————

ENOW SCOTT — FULL STACK — WEB SCRAPER — 3 years profesionnally
TechStack: Rust,
Rust — I was enthusiastic into Rust, I founded it was a solution to memory management. The philosophy of Rust feels different. Makes memory efficiency. At the beginning it was hard because of the learning scope. One of the things is I got the opportunity to get into it.
Presently I am the co-founder of the Rust Africa Association — we have 8 communities in Africa with Rust developers.
ADORSYS — customer acquisition projects. -- Full Stack Developer — with Rust particular but I also code Python. Rust. Telecom companies of Germany. Part of the team building the indemnity wallet for decentralized identities. We use Rust to develop the code identity. Components. We also work with Core Banking System. We have a Core Banking System, we provide Core banking systems. Sometimes a company approaches us. Getting clients, sometimes, they approach us, how to use Rust. I am like yeah - you gotta try. It is really good. Most of the big folks. The Core Banking System. We also experience tremendous speed. We use Rust for Bank Application, most of the time I am project lead, I am more into managing people. Banking apps with Rust. I do reviews of the developers.

What contributions — Rust Ecosystem —
Reqwest — 4
Scraper — 4
Fantoccini — 4
I implemented a project just once — an internal project. I know about web scraping a bit but I am open to learn more. I know of web scraping.
Online web scraper, experiment we were doing to scrape different websites, I got the privileged to work with these frameworks.

_____

ADRIAN SOTO SUAREZ —
TechStack: Graph Data bases, Python, Techlead of a software engineering team, Fast Api, Django, Python for web development, NodeJS and Ruby on Rails, I prefer to use python. Right now
Know a bit about Rust. Java, C#, Scala, C++.
NOTCO — In NOtCo I am doing mostly Backend with FastAPI — I like to work on data oriented products. Software engineering role. I am designing and implanting a lot a product that is data heavy. We are doing web scraping. We have like two branches, one branch is related to the food service. B2B exposing the AI of NotCo to other companies. Creating concept, taking these concepts and making ideas, then creating a formula for a product. I work with the first one, with AI doing concepts. We use web scraping to take data from competitors, we understand what are the strong points and what consumers don't like.
I am doing the API, LLMs, generative Ai
For now, we have a mix with BeautifulSOup and Spiffy, we use the Proxies in Spiffy to bypass some things. Also in my PhD I worked with Selenium.
INNOVACION IMFD
FINTUAL — I was more a Data Engineer — Now I am the tech lead of a software team. Implementing all infra for creating a data warehouse, cluster of Kubernetes, Docker, Python Script containerized on Docker to move the data form different sources to a data warehouse in BigQUery. Mostly Python, Airflow. We were in charge of looking at the data. Funnel of the clients and so on. Data Engineering and Analytics.
I havent worked with Snowflake but when I was a professor I used data bricks to use Spark
UCatolica — Ingenieria de Software / Datos / New Search Systems / PhD was on Graph Data bases, I implemented algorithms on graph systems for algorithms to work better, novel algorithms for making joins. Graph data bases that collect data across the web.
Web scraping — I love to do that — I was usingg the information available through the semantic web — exposing graph on the web, wiki data, convert it into a graph
SALARY — $5.5k after taxes I don't know how that translates in a net salary. I never worked remote, so I don't know how to work with taxes.
Relocations — to the USA — not in SF but I am open to other places. My wife is also a computer scientist, frontend developer. Frontend developer. Not to SF because is quite expensive. I have seen some pictures. I would prefer something more like Seattle.

_____

LUIS HERNANDo BENITEZ
Techstack: Python, Keras, Pandas, PySpark, DataLAkes, Azure, DataBricks, Azure cientico de datos, LangGraph, LangChain, Azure AI Agent Tool, Semantic Kernel, Gemini and OpenAi, embeddings.
NTT — Gemini Computer Vision con drones para volar oleoductos, Python, Google Cloud GCP. Hoy un agente Rag con Azure y Open AI, LangGrapgh.
Ecopetrol — Proyecto de drones.— en dron solo nos enviaba el video el video y entrenábamos, desde cero el modelo, con redes neuronales, openCD y Gemini para contexto de la imagen. Oil Operational Risks, if there is a risk, if there is a motorcycle, if there is a deforested place, or any risk, land invasion.
Banco Davivienda — Indexandfo documentos que ellos tienen y quieren responder preguntas con base a esa información.

DATA KNOW — Machine Learning - flujos, series de tiempo, modelos de optimización, data bricks, azure, fui líder técnico del equipo de machine learing. Gemini.
Postbox, Comeva, Davivieda.
English - b1 — in the project of Ecopetrol and I had one client in English because of the provider of the drone system. From the US.
SALARIO — $12.8 millones / beneficios cerva a 14M. >>> 20-30%
Relocation — Palmira —
Bogota — dispuesto a moverte
USA — si me gusta mas que bogota

_____

VINICIUS MACIEL — FULL STACK AI 3 years (not so much AI experience)
TechStack: React, VueJS, NextJS, ViewJS NestJS, NodeJS, Postgres, MySQL, MongoDb
Java, Python, ViewJS
LangGraph and LangChain — not professionally but I did some projects myself — they are private but I can make it public.
NodeJS — Nest JS is used on top of it.
BLIP — Java, Springwood, Python, Flask, ViewJS, MongoDB — I mostly work with their social media service. It is not a scraper but we gather a lot of info from social media and we get data to the clients, though dashboards automatics, apis. Even here we have a complete product, they need something new, new data or UI, I am responsible to provide this to them. I want to do something related to other users. I usually solve these problems. Deployed engineer with client. Solutions Engineers. We build solutions for clients. I am on the Solutions Engineer squat. It becomes part of the product.
Recently one thing I did, is they do classification for social media stuff, lets say you post something about CocaCola, our product captures the post and comment, it says if it is a good or bad comment, we automate classification, it will read the comment, connect with some AI to classify it. More of our AI connections is with APIs. We have our agents, the clients can feed them, they can give data, feed it and it is exclusively for the client. We have our internal AIs.
An other project is the clients can respond in any social media, easier way to propose answers to the marketing social media operators, we released a bottom that we can generate responses and do the response based on the client, a good answer for that client. A good suggestion. We need a lot of data for the client. We ask the client some questions, if somebody says CocaCola is good, or too weird, is it a good thing. We get the clients preferences on their products to do the answers. The interference as I said.
The AI is a different team but I do the connection.
ECOMILHAS — I was a full stack, JavaScript, TypeScript, NestJS, Postgres, MongoDb, Redis. MIcroservices communications.
TECHSAVVY — I integrated the authentication system. Authentication credit card transactions.
PROJECTOS DRIVEN —
SALARY — $1500 / 1.5k / + bonuses. $2.2k with bonuses >>> 30-40% increase.

_____

JOAQUIN ENCINA — AI ENGINEER — BACKEND / FULL STACK (70%Backend /30%front)
TechStack: React, JavaScript, TypeScript, Python, Django, FastAPI, Postgres, MySQL, DinamoDB, Lambdas, AWS. LangChain, LangGraph. OpenAI Agents SDK.
TREBLE — I am building features that use an SDK of AI. I am in the Core Product, which has everything. I began solving a node of ai that had hallucination. I have talked with many users. The biggest pain was allucination. Play with hallucinations without spending too much money. I made an agent of lead qualification. I am building an agentic framework or orhcestator product that uses tools to integrate with WhatsApp. I am building this product on React and Lambda and Python.
FINTUAL — I was on the Operations Team, where I was mostly in Backend — I was mostly on automations, the cashflow close of everyday. At least two hours. I was in charge of automating it and we reduced to 5 minutes. We were a wealth management platform, there is a bunch of legal and

compliance steps, so we need to follow some steps by legal reasons,to operate, we had many steps with bank interactions that don't have APIs, so we had to take screens and share data very manually. This was a feature to close everyday what people invested. Our main output was reducing the time form 2 hours to 5 minutes. Automating, we also minimize errors, as it was at the end of the day people could make many mistakes. Stack: Ruby on Rails, and front ViewJS. Mostly backend.
REX — it was my fist job in tech. Started as a junior. I became a senior developer after 6 months. I was offered the Tech Lead position before a year. I was considering that tech lead was more technical but it was very managerial but I wanted something more technical. I left to Fintual.
I built an automation module that allowed clients automate flows, I had a platform of payroll and HR. Very complex and a lot of modules. Automate flows and reports. It was a complex feature. I also built a bunch of other features.
The second time, they called me because they got an offer of Adduce, Rex was charging for payroll, because Addeco was very big with this they could get to breakeven. They could get an integrations with Dynamix, and other custom things they needed and they didnt have the capacity for making it. And we integrated ourselves with Addeco. They sold the company after Breakeven. A Norway company bought it.
Mostly a payroll platform. But also HR in general.
SALARY — $90k — $7k/month >> I want more than $100k
Relocation —
Industry — I want to keep working on AI,
Onsite:
Relocation — maybe cannot do relocation —
Remoto — preference remote

_____

STEVE PRYDE — WEB AUTOMATION RUST
Web Automation — I built
Test Automation — Test automation Selenium
I wrote a python framework with Selenium. Including test. I wrote the leading Selenium ThirtyFour — I am the creator of ThirtyFour — I am still an owner of the project.
Fantoccini — I was using Fantoccini to get it up to speed. Made me the second largest contributor.
Request — I use it all the time.
I know the capabilities and limitations
If the company need extra feats in these libraries, I can do whatever I want thirty four
OCR Labs — I work full time in Rust — I build distributed application, everything is on Lambda, AWS services, I am one of the leads. We do fraud prevention, document scanning, the official thing is ID verification. I work with web application. I mostly do Cloud application.
Sine — virtual check in — online checkin, instead of writing your name, you get batch, you get everything in. Digital. Just tell the business. App and things like that. I was there four and a half years. I did test automation. I was working on Python and learned Rust when I was there. I started using Rust. The Selenium.
Beautiful Soup once. I havent used Puppeteer but It is very similar to how Selenium works.
SALARY — $150k - $180k >>>
US timezone

_____

_____ new week september

SAMUEL HEINRICHS — AI AGENT ENGINEER
Techstack: Python, TypeScript, React, LangChain, LangGraph, PedanticAI, CrewAI,
ARIONKODER — I have worked on different projects, mostly with document processing, extracting info from documents. You have a PDF and you want to extract info from documents. —

I also worked on internal chatbots that have access to different tools, you can ask about holidays, any documents in the company.
I also worked for a healthcare company to map genes in the documents, for healthcare related documentation. (Onco-something..)
CAPGEMINI — I worked for Bradesco, financial company, I created a BI agent, you ask questions and the agent generate queries and you can ask questions aboutt your data. Like what is the churn rate for the past month or different questions of business analytics, instead of creating a dashboard panel, the charts came with your questions.
N2B Brasil — I was the first CTO — started from the beginning, and then became the Data Science Head, text classification for traditional machine learning. When CHatGPT launched we created a product to help nutritionists, have a chat for any errors and mistakes, creating nutritionist plans, if a person has an allergy or something we could create some alerts to show if the person is allergic cannot recommend these foods, help create meal plans, suggesting information of what the person needs. It is a full stack agent to help nutritionist. Assistant to Nutritionist to create meal plans. We used the OpenAI APIs directly.
WHY HEALTHCARE — I love to help people, if you do something in healthcare that impacts others you help people.
SALARY — $8.8k dollars — similar salary if gets equity. I have a commitment t

---

GABRIEL BARROS LIN — AI ENGINEER — great fit for Telepatia.
TechStack: Python, C++, LangGraph, AutoGen, CrewAI, Pedantic AI, FastAPI, Docker, Kubernetes, Cloud Environment, AWS, GCP, CI/CD Process, PyTOrch, Hugging Face, Llama, vLLM, RAG frameworks, Mulvus, ChromaDB, Deviate, PGVEctor, Pinecone, Postgres, AWS, Azure.
MICROSOFT — building an orchestator system for a big bank, manage user intent to call the right agents, understand the user needs, based on that plan call the right agents to achieve the result. I want to do a transfer to my mom and put the rest of my money into an investment fund, the orchestrator should be able to understand the two intents. I used Langgraph and a lot of custom things, not depending on the main ones. Besides that I trained a model for that. Handle better these situations just to clarify which agents to call. Doing an inference process with Azure. Mainly in the AI Foundry. I hav
GENOA PERFORMANCE — I still work with them on some projects, mainly focused on Customer Experience, telemarketing calls, I build products and multiagents system to analyze phone calls, how the operator did in the call. I built using Crew AI to evaluate the call, how the operator did, allegation, a judge of the financial answer, gather info from the company, did a final report to how an operator can improve. Built a big chatbot for calling experience and as a data analyst. I built a knowledge agent responsible for a RAG process, collecting info from a data base on user requests based on user inputs, and get arguments based in what we have to try to convince the client to not take out the money. An customer experience argumentations assistant using Langgrapgh.
RADIX —
SALARY — $6-7k — so that is my base, my expectation is 7-8k. But open to negotiate.
I am closed to Natao —
RELOCATION FOR SAO PAULO — right now not. Because I have my grandmother 92 years old, I can travel to São Paulo a couple of times month. Twice if needed.
CV — sending

ALEJANDRO LOPEZ
TechStack:
SMARTFIT — Payments Gateways — Backend with Ruby on Rails, mostly backend engineer. Ruby on Rails on the backend. Both of integrations but also making some new additions to the payments.

MERU — Full stack — A project in Mexico, Meru today is a company that consist in autoparts ecommerce for car workshops. I worked on the SaaS that was the connector to help workshops communicate with the people to sell parts and workshops to buy parts from big vendors.
GOGROW — Uruguayan Software Factory — it was more like a staff augmentation company, I worked for a US company. Full Stack Ruby front and backend. Monolithic application that you can work as a backend developer. This was a platform that was related to the phycological situation of people, this app asked you about making a kind of exam, this ensures what kind of burnout we are having right now. Blossom website: https://blossomup.co/
VAIRIX — This is an Uruguayan company as well, I worked for them for three projects. I just remember a last mile company in Spain. I am referring to a package company.
Salary: $3.2k — I am looking for something around that. This will last two months more. I am working directly.

_____

TOMAS SARMIENTO — SOFTWARE ENGINEER — GOLANG
TechStack: GO, Golang, JavaScript, TypeScript, React, NextJS, VueJS, NodeJS, NestJS, Express, Hono, PostgresQL, MySQL, SQLite, MongoDb, DynamoDB, Redis, Elastic Search, AWS.
LangChain, I know how to use it but not in production. I have learned about RAG.
HAPI APP (YC W21) — hapi.trade — it has almost a million users, trading, I am the leader of the trading module —it is similar to fintual, we are more of a trading platform. This is more for traders, it is more like Robinhood, do trading techniques. The founders are form Peru. This is a YC startup as well. Mostly backend. My main role has been to scale the trading module, my role mainly has been to scale it, make it reliable for concurrent users. My main role is to have consistency for the financial industry. Distributed Lock to avoid race conditions. My role has been to make it very consistently. I also have built microservices from scratch to monitor the prices of stocks. Built the 24/7.. The stock STOP; LIMIT orders. Monitor prices every second, I built a microservice from scratch, Monitor +10k assets every second (microservice from scratch). Monitor +10k assets every second (microservice from scratch). GTC orders (90 days in the market). After hour orders (24/7). Mentor 3 engineers, lead. Interview +40 engineers
GTC orders (90 days in the market)
LIZZA (YC W22) — creator platform to connect brands with influencers. I had to build the MVP mainly from scratch, in the frontend we had React, in the backend Golang, we were building hexagonal infra, I built the whole backend myself. I worked with the tech lead on the frontend. We had a chat for influencers to communicate with the brands, we had notifications which I built from scratch, companies publish their campaigns in which they need influencers, influencers apply to that campaign and they choose which ones. It was a very social app. That is basically it, it did not really reach a lot of request per second, we would make It very reliable and consistency. I built it from zero to one.
Personal Project — LangChain — thaffy.pro — financial tracker for WhatsApp for people to track their expenses. Has some users but not yet many users.
ENGLISH:
SALARY — $5.5k onwards. Ideally I want $6 - 6.5k.
RELOCATION — open to relocate? Depends. I am in the south of Chile.
USA roles — yes — I would move to the USA.
I would say I am advanced in NodeJS>

_____

ANDRE SANTOS BARROS
TechStack: Python, PySpark, Scala, SQL, DataBricks, Snowflake, AWS EMR,AWS,
MARLABS — Data Engineer — https://www.experian.com — Financial companies — a bank wants to give money to the client and does credit scoring, it is a scoring company in Brazil. They need to process a lot of information of each client in Brazil. I collect a lot of information about the clients, we buy info about the clients credit cards, what kind they use, if they use some apps, after they buy info, I

process info of their history in Brazil and we create a model to see if we can offer them loans or not. Credit scoring.
My main fuction is processing data and transform it, to give it to the client scoring team.
TORO INVESTIMENTOS — toroinvestimentos.com.br — our function is to understanding the pattern of our clients investments, understand the patterns, I collect these data and create dashboards for the company.
TEMBICI — I was working with Python and Django.
SALARY — $2000 per month — $4k next.
ENGLISH — good

_____

CAIO DINIZ — FULL STACK AI ENGINEER
Started as a Backend and now I am a full stack
TechStack: React, ViewJS, NodeJS, Kotlin, Postgres, MongoDB, Azure, AWS.
In Kotlin we connected with OpenAI api. In the prompt engineering we have it in MongoDB, OpenAI, we use the RAG to find the context, to use in the completion in OpenAI, we used RAG, write the prompt and get the info to the final client.
Cloud Humans — AI to answer the clients of projets — AI for Customer Service — I optimized prompts and understand how the AI was thinking, we had a process to follow, to get the way the AI is thinking, I optimize the process, I create agents that makes some functions.
I worked on the Core of the company, on this process I worked creating agents and organizing these agents to make Claudia, the general product, create and optimize the agents . We started with Text and then we implanted Voice and images and always answers in text.
Alice — The part of AI is the last part of my career. We were starting to do the same thing, AI to intermediate the process of the final client with the Operations Team, what the clients need, how AI reads the message of the final client, and read some documents that we provide to AI and return a response and collect the data for the operations team. We used Kotlin and Postgres, and we integrated with OpenAI. I used the integrations, we tried to create the agents to guide the process.
I worked on the team of member acquisition, here we have in the page, we need to guide them to become a member, develop our product and simulate our plans so the clients choose what the plan they will prefer and we worked on A/B tests to analyze the data. Where you have my resumes and conversion tests.
We had a screen to show to the client the simulation of a plan, in this plan you have 50 hospitals, that is your benefits, the plan you pay is that, we change this UI for a video to show the plans to the clients in video, so we test if the video is better. Experimentation Projects for the Member Acquisition Team. A/B. Full Stack.
SALARY — $14000 reais — $2000 dollars. —>>>>> $5k — my interest is working in English.

_____

CLAUDIO SEPULVEDA — RUBY ON RAILS — BACKEND STRONG
TechStack: Ruby, Ruby on Rails, React, Angular, TypeScript, Postgres, MySQL, SQLServer, Centri, AWS.
DUALBOOT — Validic — https://www.validic.com/ — they take info from wearables to maintain info centralized. This client centralize the info and give to different companies to offer healthcare plans and follow patients. My work is integrating new devices connecting to their APIs. The last thing I was working was improving the programmed tasks of the data base.
SPROCKETS AI — https://sprockets.ai/ — based on their different abilities and skills they help restaurants and other companies to match candidates. I worked with the SMS message seervices, with the QR codes services, I made integrations with AI.
I also worked in the workflow internal tool..
RANKMI — HR company — I arrived as the 13th engineer and when I left it was more than 400 engineers. Evaluations of performance and work culture. Results of performance. Supervising evaluation. I worked on almost every product during 5 years. I helped build some products from scratch, an API of results, to get what they wanted, graphQL, if we provide the results of performance

of employees, we developed an Api where they could connect in any format the data from their employees. Performance API. We were on the Performance team.
Payments and Payments integrations — I have a personal project and I am starting with all the payment logic with Stripe, we are waiting for the approval to be a consolidated enterprise in Florida. We are trying to build a platform for social media leads, using Meta info. You answer a survey. Send a notification to the sales man, what they want, what they sell and all the cycle.
SALARY — $4500— 10%-20%
English: Great — I worked with American clients and never got a complaint about my English.

_____

KEVIN CASABUENAS — FRONTEND ENGINEER
TechStack: JavaScript, TypeScript, React, View, NodeJS, MongoDB, MariaDB, MySQL,
OMNIPRO — I am a frontend dev — Magento for e-commerce (PHP and Laravel), JavaScript — The project is basically oriented in e-commerce, for example Alpina and other clients like Sportline, it is a store, we manage their store. I am building the store frontend, design, etc. Built the components. Navigation bar, consulting track order, whatever in the frontend.
PersonalSOFT — I was working for Bancolombia, in this case building the app for the Neighborhood ATMs, Angular, the app on the client side. Store owner. Angular.
RAPPI — two projects that were internal, I was working on the cart of the future, the client was Banorte bank in Mexico. The app that I built was the personal banker app, for managing cards and clients, tracking clients, metrics, relationships. Angular, React, View. I used microfrotnend, Nestjs and NOdejs.
ENGLISH — 7.5/10
SALARY — $4k - $5k

_____

FRANCISCO BARRERA — FrontEnd Engineer (5+ years)
Techstack: Angular, React, Astro, JavaScript, Typescript, NodeJS, NestJS, SQL, Postgres, MongoDB, Vercel, Railway, AWS.
ADL — Bre-B system — new ecosystem to make payment APIs — I am working on this project, trying to provide the technology to share between the old entities in the Aval ecosystem, we are working with microfrontend. From the frontend perspective we have microfrontend in Angular, these microfrontend must be embedded into other applications apps. Imagine, one of those entities has an app built in React Native, we have to make our app compatible with that stack. The hard part is how you can make your frontend to have more than one style.
First project was about insurance sales, that was a project where the people go into a website and have personal information. Buy an insurance plan.
Rappi — I worked building the Maps product of the curriers, so clients could see the map of their orders. The first challenge was making the fastest road to go from A to B. Calculate the time using the Google Maps API. Doing this for Dashboards for Restaurants where they can see all the orders in progress, each of those orders have a state in real time using different delivery people, it was a hard thing to make it in real time. Stack: microfrontends on Angular and React.
I also worked for payments in Rappipay — I made some backend changes in Kotlin.
ENGLISH — 9/10
SALARY — $5k — I could move from $6k if challenging.
Relocation — yes to usa.
Tourist Visa - yes
OBSBOT webcam

_____

JOHANN DAVID CALLE SANCHEZ — Frontend 5+ years
TechStack: React, JavaScript, TypeScript, NextJS, Angular, React Native,
UBITS - we built a tool to manage all the recruitment process for the organizations using a little bit of AI, we have implemented an app that can analyze the CV of the candidates and take decisions for

you and help minimize the process of recruitment for a candidate. These platform is built with React and NExtJS, I am working with them most of this year. We can help the clients reduce the time to hire.

RAPPI — Monitorei y el control de toda la operación — I was working on the app for monitoring and operations of the Ops Team, to monitor the operations, in the app we have a component that shows different metrics about the operations, orders, active orders, Curriers, Cancel Orders, Assign or unassigned orders, these metrics allowed ops teams to trigger some tools in the same app. We have a few Rappitenderos connected. In some places of the city, we had a full operation for example, 1000 unassigned orders, but we have few curriers, so the ops team could trigger to turn off the operations or turn off the operations, reduce the polygon coverage, make different decisions.
English —
$10M pesos Colombian — I would like to have 12-15 million.
Relocation — opened to it.

_____

Thiago ALLUE — STANFORD — AI FULLSTACK
TechStack: 5+ years on Generative AI — I code on different programming languages — Java, TypeScript, React, Next.js, Python, FastAPI, Golang, LangChain, LangGraph, Postgres, MongoDB, DynamoDB, AWS, Azure, GCP.
MICROSOFT — I am building an AI agent that replace the role of a QA Engineer, multi agent system. I started the project when I was working on Google, in that time we didnt have GenAI tools. Baseline in a direction to implement the prove of concept, it was successful, the client decided to work with Microsoft Engineers. I started to work with Microsoft to build a custom app with the client. I was a Senior Tech Lead, of the Core team.
I was working at Accenture, I was working in a Healthcare project, Google didnt have traction with Portuguese language, so I used a lot of things from Google, Google asked me for consultancy, after this consultancy, the client decided decided to just with Microsoft. The client is Itau.
Google paid my views and now Microsoft pay my bills. Itau was.. The main project is a multi agent system that replaces the role of a QA Engineer for Itau. Basically we started with the superintendents, 3000 software engineers, we reduced about 80% of the roles. 200-300 engineers and they tackle the most urgent and complex cases. Saves a lot of money for the clients. It was somethings like an Evil guy.
LANGCHAIN — on the second year of the project, we faced some problems with langchain and langraph, the whole community was facing the same challenges, the multi-processing and coupling with concurrency with Python. So basically in the inner forums I contributed with some proposal of architecture and concurrency approach. It was something more internal of Langchain.

_____

JUAN MANUEL RODRIGUEZ — SENIOR ENGINEER (BACKEND, SOME FULL STACK)

I enjoy doing both.
TechStack: Python, Ruby on Rails, Go, JavaScript, React, TypeScript, Postgres, MySQL, AWS.
In MeLi we have an abstraction layer for non sql data bases.
MERCADO LIBRE — I am developing a payment processor to replace a third party payment processor. Microservices for money movement. Internal initiative developed on Golang.
Also worked on another initiative in which I was in the quality of the data. Creating alerts to find out
KIAVI — they provide loans to real estate investors, we were developing the web application on Ruby on Rails, on microservices and microfrontends. I was developing the sales funnels, when potential customers saw advertisements on google, they go to our website, fill a series of forms. How much money they want to request, depending on the data, we can return an answer for the loan or not, and how much they could get, also the microfrontends. Pre-lending Product.
Originally this industry is very old school, people are requesting these forms on papers, converting it into a digital process, people who take the final decision.
MICROSOFT — Identity organization, 1000 people, from different teams, 8 people working on specific microservices, secure tokens, once you enter your credentials, your email and password and we do all the verifications, we pull the data from the data base and check credentials, and provide the secure tokens. C#
ENGLISH — great
SALARY — $5-7k
Relocation — not interested, I decided to live here. Only taking remote positions. Probably if is a hybrid in Mexico City.

_____

MICHAEL DAUNER — Software Engineer — open to anything.
If it is react I would do a Frontend in React.
TechStack: TypeScript, React, NodeJS,Express, Postgres AWS.
DEEL — I have worked with 50 microservices, each micro service can be a little bit different. Some teams use Express and some NodeJS, RestAPIs. I mostly work on Express. We have a client base app based on React and the internal one. Postgres.
I work on production issues for the clients, tomorrow is Friday and people need to get the payroll done. I need to work on it as fast as possible. Debuggings. I am working on the USA Payroll team, mostly on Debugging right now. USA has 50 states and each states has different tax laws which make it difficult to calculate. We have an engine to calculate the taxes and benefits.
I also worked on the customer experience team, building new payroll features, client onboarding, full stack. When we have a new client we need to onboard employees, I built onboarding steps to sign all the documents in one. I implemented it so they can sign it just once.
I also built a supportive time tracker, when you have hourly employees. Also a vacation module. Calculations for hours for the payroll.
ADMIOS — it was basically on TypeScript, — I was working on three or four different projects. The biggest project about food trucks management, a big companies in San Francisco, they enter the menu and clients can order through an app. Node in the backend and two React Native apps, one for clients and one for sellers. 4 teams and 5 developers.
SALARY — $6k / month — I want something around that, the thing is I love working at Dell but I have been here for 3 years, so for the right thing I would be exciting to change.
ENGLISH — great!'
Relocation — NO

_____

JAFREY SANCHEZ — FROTNED ENGINEER — 7+ yers on ReactJS
TechStack: ReactJS, React Native, NextJS, Postgres, MySQL.
I don't know much about backend. I know a little bit of architectures, microservices, clean architecture, different modules. Always developed frontend apps.
PATAGONIC — Forge stock market — https://forgeglobal.com/ — I am on the side of the frontend with my team we made different features inside the marketplace in the search engines, I receive

different figs and features and I implement them. This company changes many things always. I am mostly at the side of the marketplace, at the side of the view of the client, all the list of companies, what is the maximum capacity of investors of some companies. Changing the visuals of the marketplace.
UBITS — B2B I started in this company, they have different courses for business employees. 3000 different kind of course. When I started they only had a Wordpress page, they contracted me to have data bases, actual products, I built a lot of things, different components, we made the section of the student to onboard, sign in, courses customer experience for students. I spent a good time on this. We applied different architectures like hexagonal architectures and we built all the site in microfrontends. We had different teams to organize the products.
I was an early engineer. I was the first group of devs.
SALARY — $4k / month — my type of contract is legal contract. I need a credit bank. So I want an a larg
Relocation —
Toursit visa —

_____

WINSTON STEVEN RUIZ — FRONTEND / FULL STACK / 7-10 years of experience.
TechStack: React, NextJS, NodeJS, MySQL, Postgres, MongoDB, DynamoDB, AWS
SIMETRIK — I have worked on React and NodeJS, migrating a large monolith to microfrontends applications. In the end we implemented and achieved the reduction of loading times, made deployments more efficient and less dependents, easier to work on parallel.
Building the frontend of the ChatBot for all the context related to Symetics, so the people can type and get different questions and answers from the financial data and customers tool inside the Symetic team. Also some clients use the tool. Simetrik is a SaaS app, so the people make reconciliation and we have two data bases, side A and side B and we compare on both sides, and output the data that is missing. With the Chat the people can know what is a reconciliation for example, the chat explains in detail all the things related to that, the logic of the reconciliation and any questions for these.
MUNI — ecommerce marketplace for vegetables, sell different products, women can have their stores and sell within the community. I was working on the main web marketplace where clients can buy all the things in the ecommerce platform. I worked a lot on the checkout experience.
HABI — I built a platform related to the brokers, the brokers could see all the apartments available, all the buildings, the houses, all the available for sale. The idea is that the broker help with this, show the apartments. All the different clients, make a book or reservation with these apartments. A platform for only the brokers for their workflow.
RAPPI — I worked on the main application web for delivery. When people make the orders, I was working on log in, the orders, checkout and delivery.
ENGLISH — good enough

SALARY — $4500 >>>
Relocation? Remote
I would love to relocate to the USA.

_____

BRENNEDITH GARCIA — SENIOR FRONTEND ENGINEER — FULL STACK and Backend Strong — TOP
TechStack: JavaScript, TupeScript, React, Angular, View, Express, NestJS, Golang,
Luxury Presence — Mid market clients, mostly backend, adjust the SaaS to the need of the client, the last project was mostly backend with architectures, AI for expediting real estate deals, if they have content and a website, the platform import that data with web scraping to adjust it to our content in our CMS, has helped them to do this automatically to post their websites.
KAVAK — Started as a frontend and then moved to a Staff Engineer Role, then Full Stack and DevOps — I was in almost all product. First started with the tools for auto-parts, then on the Human Resources gamification for mechanics, then e-commerce. They built a platform. We built the platform

team and product. The internal platform is automated. The infrastructure is great. They hace teams of DevOps. Create resources, compute, automate all those things. First with the manifiesto, and cli, command line interface. Each team can raise their requirements and the resources they need. Any developer could raise their requirements and assign to team with costs, how is each team operating, how much is it costing to companies and it was automated.
ENGLISH —
SALARY — $7.5k —> I am looking for large impact
Relocation — I am from Honduras but live in Mexico.
Tourist Visa until 2028.
MISSION — Real estate is not as nice for me, I want to feel more passionate.

_____

_____
FABIAN LUNA — SOFTWARE ENGINEER — 14+ years — FULL STACK
Started as a web dev using Wordpress and PHP in general, then as a frontend dev with Angular and React. The latest techs, it is a full stack using from backend and frontend typeScript and JavaScript.
TechStack: React, TypeScript, JavaScript, AngularJS, NextJS, NodeJS, NestJS, MySQL, Postgres, MongoDB, AWS.
QUBIKA — Software Factory that provides clients, I am working on testing in Software Engineering. Hybrid between backend and DevOps. Bank from USA - we work with the employees inside there
Coastal Bank - https://www.coastalbank.com — I joined two or three months there.
Before I worked on ROYO AI — https://www.royo.ai I modified in the landing page, the workflow of the sign up, the Stripe subscription, I integrated this app with the backend.
VENDOO — Startup from USA — https://www.vendoo.co — full stack connecting marketplaces to our platform to get and post information. We used a Google extension to manipulate this. Send the information and get one. Very hard but we built the app very well. Cookies to read if the user is logging or not in the platform, does it have the cookie or not? We used web scraping, read the endpoint from these marketplaces, Etsy is one of these, we retrieved the information using the endpoint. 5-6 marketplaces at the same time, we created a hub and we post that information. So I worked on the Core platform. I was 50/50. I started as a frontend creating the subscription and inventory UI and then started manipulating the backend on firebase with Node, Mongo and Elastic Search.
ANOMALI — Frontend Developer to UI for two products, threadstream product which is a security platform where you update the info of the security of the company. AnomaliLens - read the information of the page, scraping for security, to try to understand if the information of this website is secure or for malware.
MILO — ….
SALARY — $4.5k / I would go for 1k more
Relocation to the USA? — Just remote.

_____
JUAN ORTIZ — SENIOR FRONTEND ENGINEER
TechStack:
D3690 — Frontend — Fintech company. They have two models, B@C B2B, in the last years, I built several application where we can see the prospects. We can also see the integrated communication tools.
B2b offers a portal where real state can have all prospects. They can do a lot of things related to the real estate and manage their businesses there.
B2C - they have a free portal where a user can search about house in sale and they can see their properties in the market, compare two properties, and they can get a loan.

I participated in the B2B, so a real estate company can build dynamically their websites, with widgets, technically you are browser editor where the user can configure their websites. The final user, the client that is looking at the website is processing a json
KAVAK (Unicorn in Latam / 30th employee)— A platform to sell used cars in Mexico, Brazil and Turkey. I was part of the tech foundations team. I entered in a moment when we didnt have any application. I entered pre-product, when the company had 30 employees.
I would say in the first years was the delivery fast, have a balance between, I participated in the main website of the company, they also had internal applications but my main focus consumer facing app for Mexico. I led the development team for the experience, track current state of a client, see what steps they were taking, have a conversation if he had any issues. Also I took architectural decisions on the whole app tech stack. I led the microfrontend strategy, I established a development guide for performance metrics, monitory part of the app, alerts and errors.
SALARY — $4000 also with a bonus which is based on performance, for example this year the bonus is about 5.6 months of salary. So it is like 5-6k. So I earn 5640 dollars.
Relocation — Not right now.

_____

LEO OMANA — FRONTEND ENGINEER
TechStack: React, NextJS, JavaScript, TypeScript, Angular,
GLOBANT — Frontend Dev — EY
EY —My project is a user interface library, a design system for internal projects, EY - they have a lot of internal projects, my role is creating their frontend component library for when we manage inputs, fields, buttons, tables, etc, to work in a lot of projects. I have a lot of meetings too with stake holders. I am the leader of 8 frontend developers from India, Argentina and Colombia whille I am an Individual Contributor as well. Material UI, Design, I work with TypeScript and JavaScript, web components. You can work with a framework. Mostly with React and Angular, and I am the expert of React Library.
RAPPI — I worked for 4 years, first I worked as a frontend developer in the Restaurants Vertical, for partners, it is more like the platform that manages the restaurants, high level users. For example, the owners of the restaurants. Mainly creating dashboards to understand the data, performance, reviews, and helping them create the menus, custom search, convos, promotions, individual product offerings. I worked migrating to microfrtontends from monorepo. NExtJS.
MERQUEO — I was working on the shopping cart and the product catalogue, with ViewJS. I contributed to the project, more than shopping cart my job was mainly on the product catalogue, creating for example topicalization, consume data to print in the UI, unit testing, working with global state, these projects I worked only three months. Was a little project.
Salary — $20 million pesos — I would need $6.5 dollars or $7k.
Relocations — YES — Perfect Remote —
Tourist Visa — NO.

_____

MAURICIO OROPEZA GOMEZ — SENIOR SOFTWARE DEV (BACKEND strong) also full stack.
TechStack: NestJS, NodeJS, Postgres, Redis, MongoDB, AWS, GCP.
KAVAK — I am responsible for the post-sale process, process where we do guarantee and when car owners have a problem. For example we have an assistant to handle all the subscription lifecycle in the company where you can buy a car, we offer subscription coverage to protect the car, I am responsible for the experience and process of the lifecycle of the subscription of the coverage that we offer. I am responsible for all these backend features and the backoffice for the people at the company to allow them to sell coverage plans and tickets for guarantee process, we offer these features for the client and the Kavak application to handle the process.
DACODES
SALARY — $4k-5k -> wants $5.5-6k
Relocation — YES, interested, but I don't know if the company can offer a visa that includes my family. Wife and I have children. And I hope if I have the possibility I would need to relocate them.
